This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

DEPARTMENT OF PUBLIC WORKS.

ARTICLE I. The Commissioner of Public Works.
II. The Commissioner's Secretary.
III. The City Engineer.
IV. The Superintendent of Streets.
V. The Superintendent of Water.
VI. The Superintendent of Sewerage.
VII. The Superintendent of Special Assessments.
VIII. The Superintendent of Maps.

ARTICLE I.

THE COMMISSIONER OF PUBLIC WORKS.

551. There is hereby established an executive department of the municipal government of the city of Chicago, which shall be known as the department of public works, and shall embrace the commissioner of public works, a secretary to said commissioner, the city engineer, the superintendent of streets, the superintendent of water, the superintendent of sewerage, the superintendent of special assessments, the superintendent of maps, and such other assistants and employes as the city council may, by ordinance, prescribe and establish.

552. There is hereby created the office of commissioner of public works, who shall be the head of said department of public works, and shall hold his office for the term of two years, and until his successor shall be appointed and qualified. He shall have the management and control of all matters and things pertaining thereto; and the appointment and removal, with the consent of the mayor, of the subordinate officers named in the last preceding section; and said subordinate officers may, with the consent of the commissioner, appoint and remove all employes in their respective departments.

Digitized by Google

553. Said commissioner shall appoint all other employes in said department, and in addition to the number of clerks, assistants and employes regularly employed and provided for by ordinance, may appoint such other clerks, assistants and employes as he may deem necessary to properly perform the work in said department; and he may remove any such assistant, clerk or employe at his pleasure.

554. Said commissioner of public works shall be appointed by the mayor, by and with the advice and consent of the city council, on the first Monday in May, 1881, or as soon thereafter as may be, and biennially thereafter.

555. Said commissioner, before entering upon the duties of his office, shall execute a bond to the city of Chicago, in the sum of fifty thousand dollars, with such sureties as the city council shall approve, conditioned for the faithful performance of the duties of his office.

556. It shall be the duty of said commissioner to require good and sufficient bonds to be given by all subordinate officers and employes in said department of public works who shall receive or have the care, custody or handling of any moneys belonging to the city of Chicago; which said bonds shall be approved by the mayor.

557. Said commissioner shall have charge of all public improvements, commenced or to be commenced by said city, and of all special assessments; and shall have power, subject to the ordinances of the city, to regulate and control the manner of using the streets, alleys, highways and public places of the city, for the erection of telegraph poles or other poles and posts; for the laying down of gas, water or steam pipes and sewers authorized by law or the ordinances of the city, and to determine the location thereof; and to cause the prompt repair of the streets, alleys, highways and public places, whenever the same are taken

Digitized by Google

up or altered: *Provided, however*, that nothing herein contained shall be construed to repeal, or in any manner conflict with any provision of this ordinance creating the department of buildings: *and provided, further*, that the abatement and removal of all nuisances shall be in special charge of and under the control of the department of health.

558. It shall be the duty of said commissioner of public works, subject to the provisions hereof and the ordinances of the city, to take special charge and superintendence of all streets, alleys, lanes and highways in the city of Chicago, and of all walks and cross-walks, bridges, viaducts, docks, wharves, public places, public landings, public grounds and parks in said city; of all markets, market places and market houses; of all engine houses, hospitals, armories, and all other public buildings in the city, belonging to the city, and of the erection of all public buildings; of all lamps and lights for the lighting of streets, alleys, lanes, highways, bridges, viaducts, parks, public places and public buildings of the city, and of the erection and repair of such lamps and lights; of all works for the widening, deepening or dredging of the Chicago river and its branches, and of the harbor of said city; of all sewers and works pertaining thereto; and of the water-works of said city; and he shall collect all water rents, water taxes or assessments, water licenses and permits, and all sewerage permits and licenses.

559. Said commissioner shall control and direct all expenditures to be made by the department of public works; shall sign and draw his requisition upon the comptroller for the payment of all bills and accounts therefor which in his judgment are correct, and which may be duly certified by the superintendent under whose supervision the expenditure was incurred.

560. No payment shall be made on any work or job done by contract, for any extra work not specified in the contract, un-

Digitized by Google

less such extra work shall have been done by the written order of the commissioner of public works, to be annexed to such contract, directing the same, and stating that such work is not included in the contract: *Provided*, that any order given under this section shall state what the extras are, and that such extras are necessary for the proper completion of, or for the security of, the work previously done, and the reasons therefor.

561. All moneys payable by the corporation, for work done or supplies furnished by contract or otherwise, under the department of public works, shall be paid by the comptroller upon the requisition of the commissioner of public works.

562. All contracts for the making of any public improvement to be paid for in whole or in part by special assessment, and any work or other public improvement, when the expense thereof shall exceed the sum of five hundred dollars, shall be let to the lowest responsible bidder, after advertising the same, and shall be approved by the mayor; but any such contract may be entered into by the said commissioner without advertising for bids, and without such approval, by a vote of two-thirds of all the aldermen elected.

563. Whenever any public improvement shall be ordered by the city council, which is to be paid for by special assessment, and the assessment for the same shall have been finally confirmed, and one-half of the special assessment shall have been paid into the city treasury, the commissioner of public works shall advertise in some newspaper printed in the city of Chicago, of general circulation, for proposals for doing said work: *Provided, however*, a contract for said work may be made before one-half of the special assessment is collected, if authorized by a vote of two-thirds of all the aldermen elected: *and provided, also*, when a portion of the work on any public improvement is done by private contract, under the authority of the city council,

Digitized by Google

the remainder of the work upon such public improvement may be let at any time after the assessment thereof shall have been ordered by the city council. A plan or profile of the work to be done, accompanied with specifications for the doing of the same, shall be first placed on file in the office of said department, before any such advertisement shall be made, which said plan, profile and specification shall, at all times, be open for public inspection; such advertisement shall be published on five separate days, the first publication to be not less than ten days before the day fixed for opening said proposals, and shall state the work to be done.

564. In all cases, the bids for doing any work, or making any public improvement, shall be sealed bids, directed to said department, and shall be accompanied with a deposit, the amount of which shall be fixed by said commissioner, and named in said advertisement, and which shall not exceed five per cent. of the estimated cost of the improvement or work to be done, nor be less than the sum of one hundred dollars. Said deposit shall be in money, or a certified check upon some Chicago bank, in good standing, payable to the order of said commissioner, and shall be forfeited to the city in the event that the bidder shall neglect or refuse to enter into a contract (with approved sureties) to execute the work for the price mentioned in his bid, and according to the plans and specifications, in case the contract shall be awarded to him. Said bids shall be opened at the hour and place mentioned in said notice; and should said bid or bids be rejected, or should it become necessary, for any other reason, to re-advertise for proposals to do said work, such subsequent advertisement may be, at the discretion of said commissioner, for three instead of five days, as required in the first instance. Said commissioner may, in said advertisement, reserve the right to reject any and all bids.

Digitized by Google

565. All contracts, exceeding in amount the sum of five hundred dollars, for work, materials, or supplies, relating to any of the matters under the cognizance of the department of public works, shall be let by the commissioner of public works to the lowest reliable and responsible bidder or bidders, whose bid does not exceed the estimate; and bonds to be approved by the commissioner, shall be taken for the faithful performance thereof; all such contracts shall be executed in triplicate by the commissioner of public works, on the part of the corporation, and by the contractor; one original copy so executed shall be kept and filed in the office of the commissioner of public works, one shall be filed in the office of the comptroller, and the third shall be given to the contractor. All contracts, and bonds so taken, shall be in the name of, and run to the city of Chicago; and every contract, for a sum greater than five hundred dollars, shall have the consent, in writing, of the mayor endorsed thereon, and shall be countersigned by the city comptroller.

566. No contract shall be made for any work or supplies relating to any of the matters within the cognizance of the department of public works, unless such work or supplies shall have been authorized by the city council, except that whenever any such work or supplies shall be necessary, and the total cost thereof shall not, in any one case, exceed five hundred dollars, the commissioner of public works may cause the same to be done or furnished, under the supervision of the appropriate officer of the department; but no such expenditure shall be made without the written order of the commissioner of public works, through his secretary, which order, when filled, shall be returned and filed as a voucher in said department, with the bill upon which payment was made.

567. In all cases, before such supplies, work, materials or necessaries of any kind shall be ordered or purchased by said department, exceeding in amount the sum of two hundred dol-

Digitized by Google

lars, and not more than five hundred dollars, said commissioner shall first obtain, in writing, at least three informal bids to furnish the same, which said bids shall accompany, and be filed in every case, with the voucher upon which the requisition for payment of the same is issued.

568. In all contracts executed by said commissioner, on behalf of the city, the right shall be reserved to said commissioner to finally decide all questions arising as to the proper performance of said work; and in case of improper construction, or of non-compliance with the contract in any manner, to suspend said work at any time, or to order the partial or entire reconstruction of said work if improperly done, or to declare the contract forfeited, and to re-let the same without further advertisement; and to adjust the difference of damages or price (if any there be) which the contractor or contractors failing to properly construct such work in such cases of default, should pay to the city, according to the just and reasonable interpretation of said contract.

569. In cases where the contractor or contractors shall proceed to properly perform and complete their said contracts, the said commissioner may from time to time, as the work progresses, grant to said contractor or contractors an estimate of the amount already earned, reserving fifteen per cent. therefrom, which shall entitle the holder or holders to receive the amount that may be due thereon when the money applicable to the payment of such work shall have been collected, and the conditions annexed to said estimate, if any, shall have been satisfied.

570. All contracts entered into by the said commissioner of public works on account of the water or sewerage works of the city, shall specify that they are for such works.

Digitized by Google

571. All contracts in which the contractor or contractors agree to be paid from special assessments, shall contain covenants in substance to the effect that such contractor or contractors shall have no claim or lien upon the city in any event, except from the collection of the special assessments made for the work contracted for; and that no liability of any kind shall attach to the city by reason of the entering into such contract, except for the payment over to such contractor or contractors of moneys received by the city under special assessments levied or to be levied for the improvement specified in such contract, and no contract for work to be paid for by a special assessment shall be let except to a contractor or contractors who will so agree.

572. In case the prosecution of any public work shall be suspended in consequence of the default of any contractor or contractors, or in case the bids for doing such work shall be deemed excessive, or the person or persons making proposals are not, in the opinion of said commissioner, responsible or fit to be entrusted with its performance, the said commissioner of public works may, with the approval of the city council, where the urgency of the case and the interests of the city require, employ workmen to perform or complete any improvement ordered by the city council: *Provided*, that the cost and expense thereof shall in no case exceed the amount assessed or the sum appropriated for completing the same.

573. Whenever said commissioner or any other city officer shall let any work or improvement which shall require the digging up, use or occupancy of any street, alley, highway or public grounds of said city, there shall be inserted in the contract for the same, substantial covenants requiring such contractor, during the night time, to put up and maintain such barriers and lights as will effectually prevent the happening of any accident in consequence of such digging up, use or occupany of any street, alley, highway or public grounds, for which the city might be

Digitized by Google

liable, and also such other covenants and conditions as experience may prove necessary to save the city harmless from damages. And also to provide in such contract, that the party contracting with the city shall be liable for all damages occasioned by the digging up, use or occupancy of such street, alley, highway or public grounds, or which may result therefrom, or which may result from the carelessness of such contractor, his agents, employes or workmen.

574. Whenever any work or improvement is let by contract, to any person or persons, firm or corporation, the officers of the city letting the same shall, in all cases, take a bond from such person, persons, firm or corporation, with good and sufficient sureties, in such amount as shall not only be adequate to insure the performance of the work in the time and manner required in such contract, but also to save and indemnify and keep harmless the said city against all liabilities, judgments, costs and expenses which may in any wise accrue against said city in consequence of the granting of such contract, or which may in any wise result from the carelessness or neglect of such person, persons, firm or corporation, or his, their or its agents, employes or workmen, in any respect whatever; and conditioned also, that when any judgment is recovered against said city by reason of the carelessness or negligence of such person, persons, firm or corporation so contracting, or his, their or its employes or workmen, and when due notice has been given of the pendency of such suit, such judgment shall be conclusive against such person, persons, firm or corporation, and his, their or its sureties on such bond, not only as to the amount of damages, but as to their liability; and conditioned also for the payment of all claims and demands whatsoever which may accrue to each and every person who shall be employed by such contractor, or any assignee or sub-contractor of such contractor, in or about the performance of such contract.

Digitized by Google

575. It shall be the duty of the commissioner of public works, in letting any contract for any sewer, public improvement or other work, to insert in the contract therefor, a condition to the effect that it shall and may be lawful for said commissioner, whenever he shall have reason to believe that the contractor has neglected or failed to pay any sub-contractor, workman, or employe for work performed on or about any public improvement, sewer or other work contracted for, to order and direct that no further vouchers or estimates be issued, and no further payments be made upon such contract until such commissioner shall be satisfied that such sub-contractors, workmen and employes have been fully paid. Every such contract shall also provide, that a certain percentage (not less that fifteen per cent.) shall be reserved out of the moneys earned upon such contract, and that such percentage shall not be payable until such contractor shall satisfy such commissioner or officer letting such contract that all sub-contractors, workmen and employes have been fully paid.

576. Whenever the commissioner shall notify the contractor by notice personally served, or by leaving a copy thereof at the contractor's last place of abode, that no further vouchers or estimates will be issued, or payments made on the contract until the sub-contractors, workmen and employes have been paid, and the contractor shall neglect or refuse, for the space of ten days after such notice shall have been served, to pay such sub-contractors, workmen or employes, it shall and may be lawful for the city to apply any money due, or that may become due under the contract, to the payment of such sub-contractors, workmen and employes without other or further notice to said contractor; but the failure of the city to retain and apply any of such moneys, or of the commissioner to order or direct that no vouchers or estimates shall issue, or further payments be made, shall not, nor shall the paying over of such reserved percentage, without such sub-contractor, workman, or employe being first paid, in any way

Digitized by Google

affect the liability of the contractor or of his sureties to the city, or to any such sub-contractor, workman or employe upon any bond given in connection with such contract.

577. All sewers and drains in any of the streets, alleys, avenues, or public places in the city shall be under the charge of the department of public works, which shall keep the same in good order and condition, and clean and free from obstructions, and shall cause to be made such repairs thereof and of the receiving-basins, culverts, and openings connected therewith, as may from time to time become necessary.

578. The commissioner of public works shall prescribe the mode of piercing or opening any of the sewers or drains, and the form, size, and material of the connections made therewith, and shall have authority to grant permission to make lateral connections with said sewers.

579. No connection shall be made with any sewer or drain without the written permission of the commissioner of public works; nor shall any person drain from any point within the limits of the city of Chicago, into the Chicago river or any of its branches, or into any slip connecting therewith, or into any canal or canals constructed under the authority of said city, without first obtaining a permit for such drainage from said commissioner of public works; and said commissioner is hereby authorized to grant such permits, and to exact a license fee therefor, to be fixed by said commissioner, which said license fee shall be equal to an amount sufficient to defray the expense imposed upon the city, in consequence of granting such permission. And any person making any connection or opening into any sewer or drain, or draining from any point within the city limits into the Chicago river or its branches, or into any canal or canals as aforesaid, without such permission, or in a manner different from the mode prescribed by said commissioner, shall subject the person making

Digitized by Google

the same and the person directing it, respectively, to a penalty of fifty dollars, and twenty-five dollars for each and every day the same is continued.

580. The commissioner of public works may grant permission to persons to construct, at their own expense, sewers or drains, to lay pipes to connect with any sewers or drains built in any of the streets, alleys or avenues in the city, charging a license fee therefor, of five dollars in each case; but such permission shall not be granted except upon the agreement, in writing, of the persons applying therefor, that said work shall be performed by some person or persons duly licensed therefor, and that they shall comply with the ordinances in relation to excavating the streets; that they will indemnify the corporation for any damages or costs to which it may be put by reason of injuries resulting from neglect or carelessness in performing the work so permitted; and that no claim will be made by them or their successors in interest against the corporation, if the work so permitted to be taken up by the authority of the city council, or for exemption from an assessment lawfully imposed for constructing sewers or drains in the vicinity of their property; and upon the further condition that the city council may at any time revoke and annul such permission, and direct such sewers, drains, or pipes to be taken up or removed.

581. No permit shall be granted to any person or persons, corporation or corporations, to open a paved or improved street or alley, unless the party applying therefor shall have first deposited with said commissioner a sum of money sufficient to cover the expense of replacing the same in as good condition as before opening. Said opening shall in every case be replaced by the city, and the actual cost thereof shall be borne and paid by the person or persons, corporation or corporations, for whom such opening was made.

Digitized by Google

582. The commissioner of public works shall keep a record of all permits granted for connections with sewers or drains, in which he shall enter the names of all persons from whom he may receive money for such permits, with the amount received from each person, and the time when it was received.

583. When the expense of any work or public improvement shall exceed the sum of five hundred dollars, and the same is to be paid out of the general fund, or the water or sewerage fund of said city, the doing of said work shall be let by contract, in the same manner as is provided in cases where the expense of the same is to be paid for by special assessment.

584. In all cases, before the letting of any contract, where bonds are required to be taken by the commissioner of public works, the sureties therein shall deposit with said commissioner a statement, under oath, showing the real property owned by each surety, the location of the same, its value, and the amount of incumbrance or incumbrances, if any, thereon.

585. All moneys to be paid to any person or persons out of the water or sewerage funds, or any special assessment fund shall be certified by the commissioner of said department, or, in his absence from the city, or incapacity by sickness, to act, by the mayor of the city, to the city comptroller, and a warrant therefor shall be drawn, stating therein the particular fund to which the same is chargeable.

586. Neither the commissioner of said department, nor any superintendent, officer, clerk, or other person employed in said department, shall be interested, directly or indirectly, in any contract made or entered into by said department for any work or for any material to be furnished, and all contracts made by said department in which the said commissioner, or any officer or employe of said department, shall be so interested, shall, at the option of the city, be declared utterly void, and of no binding

Digitized by Google

effect whatever, and any officer of said department interested in any contract shall thereby forfeit his office, and be removed therefrom on proof of such delinquency, and it is hereby made the duty of said commissioner, and of the mayor, and of every city officer, to report to the city council any such delinquency when discovered.

587. No officer or employe of said department shall, either directly or indirectly, receive any interest or profit whatever, on account of the deposit of the city funds, nor shall any such officer or employe, either directly or indirectly, make use of or borrow any of said funds for his own private benefit or advantage.

588. Said commissioner shall, on or before the first day of May in each year, prepare and present to the city council a report showing the receipts and expenditures and entire work of his department during the previous fiscal year.

589. The commissioner of public works shall, within thirty days after the commencement of each fiscal year, submit to the comptroller, to be by him laid before the city council with his annual estimates, a statement, as near as the same can be estimated, of the repairs and improvements to be paid for out of the general fund of the city, and necessary to be undertaken by said city during the current year, and of the sums required by said department to make such repairs and improvements, as near as can be estimated; and also, a statement as to any desired improvements, with the probable expense thereof; and of all contracts made and unfinished; and the amount of any and all unexpended balances of appropriations of the preceding and prior years. Said report shall be in detail. The city council, having revised, changed or altered the estimates so submitted, may provide for raising the same, in the annual appropriation bill or ordinance.

590. It shall be the duty of said commissioner to cause to be kept books of account, in such manner as to show with entire accuracy, the receipts and expenditures of said department, and in such manner that the same may be readily understood and investigated; and also to preserve on file in said department duplicate vouchers of all the expenditures of said department, which books and vouchers and all papers and files of said department shall be at all times open to the examination of the comptroller, the finance committee, or any member of the city council.

591. The commissioner of public works shall in all matters whereby, by reason of any ordinance, resolution, agreement, or act, heretofore passed, entered into or done, the action of a board of public works is necessary, constitute a board of public works for such purpose, and shall do and perform all things required to be done by or imposed upon said board.

592. In all cases where provision is made by ordinance that the consent of the commissioner of public works shall be obtained to authorize any act to be done, he may grant a permit therefor, subject to the restrictions of the ordinances in relation thereto.

593. The commissioner of public works may direct the removal of any article or thing whatsoever, which may encumber or obstruct any street, avenue, or alley in the city of Chicago, under the penalties prescribed by law.

594. The commissioner of public works shall, when required by the city council, inquire into and report upon any of the matters within the cognizance of the department of public works, and shall, from time to time, communicate to the city council any information or suggestion which he may deem important in relation thereto.

595. All subordinate officers, assistants, clerks and employes employed in said department shall be subject to such rules and

Digitized by Google

regulations as shall be prescribed from time to time by said commissioner.

ARTICLE II.

THE COMMISSIONER'S SECRETARY.

596. There shall be in the office of the department of public works a person to be denominated secretary to the commissioner of public works, whose duty it shall be to preserve and keep all books and papers belonging to said department, or which are required by law to be filed therein.

597. He shall deliver to the city council and to the respective departments, all communications from the said commissioner in writing, and shall attend in the office of said department during the usual office hours, and do and perform such other services as may be required by said commissioner.

ARTICLE III.

THE CITY ENGINEER.

598. The city engineer shall perform such duties as may be required of him by the commissioner of public works, or the ordinances of the city.

599. He shall perform all such services in the prosecution of public improvements, as may require the skill and experience of a civil engineer.

600. He shall have charge of the construction and repairing of all bridges, viaducts and water works, and shall superintend the laying of all main and supply water pipes.

ARTICLE IV.

THE SUPERINTENDENT OF STREETS.

601. The superintendent of streets shall perform such duties as may be required of him by the commissioner of public works, or the ordinances of the city.

Digitized by Google

602. He shall have charge of the improvement, repair and cleaning of all streets, avenues, alleys and highways in the city of Chicago, and the construction and repair of all sidewalks.

ARTICLE V.

THE SUPERINTENDENT OF WATER.

603. The superintendent of water shall perform such duties as may be required of him by the commissioner of public works, or the ordinances of the city.

604. He shall have special charge of the assessment and collection of all water rates or assessments.

605. Said superintendent shall report to the city treasurer, once in each day, all moneys received by him in said department of public works, and at the same time pay over to the said city treasurer all such moneys, with a statement of the same: to what account the same belongs,—and shall take a receipt and duplicate receipt for all moneys so paid over, which said duplicate receipt he shall deposit forthwith with the said commissioner of public works.

ARTICLE VI.

THE SUPERINTENDENT OF SEWERAGE.

606. The superintendent of sewerage shall perform such duties as may be required of him by said commissioner of public works, or the ordinances of the city.

607. He shall have special charge of the construction of all public and private sewers and catch-basins, and the issuing of all permits and licenses in connection therewith.

ARTICLE VII.

THE SUPERINTENDENT OF SPECIAL ASSESSMENTS.

608. The superintendent of special assessments shall be *ex officio* examiner of subdivisions, and it shall be his duty to exam-

Digitized by Google

ine all plats and maps of subdivisions of land in the city of Chicago, upon presentation of the same to him, and if he shall approve of the same, he shall so certify. He shall also perform such duties as may be required of him by said commissioner of public works or the ordinances of the city.

609. He shall have special charge of all proceedings connected with the making of special assessments, subject to the directions of the corporation counsel.

ARTICLE VIII.

THE SUPERINTENDENT OF MAPS.

610. The superintendent of maps shall perform such duties as may be required of him by said commissioner of public works, or the ordinances of the city.

611. He shall have special charge of all matters pertaining to the keeping of the records of maps, plats, &c., recorded in the city of Chicago; and of all matters pertaining to street numbers; and he shall make all maps and drawings which may be required by said department.

Digitized by Google

COMMISSIONER'S REPORT.

OFFICE OF THE COMMISSIONER,
CITY HALL.

To the Honorable, the Mayor and City Council of the City of Chicago.

GENTLEMEN:—I have the honor to submit herewith the Twelfth Annual Report of the Department of Public Works, for the year ending December 31, 1887. In consequence of the resignation of W. H. Purdy, Esq., the present incumbent was on the 12th day of April last, appointed and qualified as Commissioner of Public Works, assuming the duties of the office on that date. In presenting this report to your Honorable Body, I would respectfully refer you for more explicit information, to the statements in detail of the Superintendents of the various Bureaus, which mention the several classes and the work and improvements carried forward under the supervision of the Department, together with the cost. The rapid growth of the city in the outlying districts, making

Digitized by Google

it necessary to extend the water and sewerage system, with other essential public improvements, taxes the ability of the Department to meet such demands with the funds placed at its disposal, through the annual appropriation. By securing extensive competition in the purchase of material and in the letting of contracts, the Department has succeeded in accomplishing more than was anticipated in the early part of the season, and the result has been very gratifying.

An examination of this Report by your Honorable Body will, I think, prove satisfactory, and show an honorable and economical expenditure of the funds appropriated.

EXTENSION OF WATER SYSTEM.

42.21 miles of water pipe from 4 to 36 inches in diameter, were laid during the year, making a total of 638.23 miles at the close of the year.

304 new water valves were added: total in use 4,736

549 new fire hydrants were added: total in use 5,899

5 fire cisterns were added: total 46

8,807 new house service taps were added: total in use..... 115,578

8,807 new house service pipes were added: total in use..... 115,578

Number of service taps inserted in water mains, including retaps..... 9,438

Digitized by Google

EXTENSION OF SEWERAGE SYSTEM.

17 miles of brick and pipe sewers, from 12 inches to 7½ feet in diameter, were constructed during the year, making a total in use of 472½ miles.

756 new catch-basins were added, making the total number 15,234

605 man-hole chambers were added, making the total number 16,903

Old catch-basins raised to grade 1,616

Old man-hole chambers raised to grade 1,519

Old catch-basins and man-holes repaired 308

Number of catch-basins cleaned 12,503

Sewers cleaned ..... 284 miles.

House drains laid ..... 21½ miles.

STREET IMPROVEMENTS.

There were 681,265.36 square yards, or 36.75 miles of street pavement laid during the past year.

There were 216,199 square yards of street pavement repaired ; 1.56 miles of street planked.

There were 91,571 square yards of pavement laid by Street Railway Companies in streets occupied by their tracks.

Total number of miles of paved streets.	306.85	miles.
New sidewalks constructed	42.50	"
Sidewalks reconstructed	127.15	"

Digitized by Google

Sidewalks repaired	36.29 miles.
Total sidewalks in city	1,007.44 "
Streets cleaned	3,513.92 "
Number of aprons, culverts, crossings, etc., built	7,589
Street lamps erected (gas)	1,542
Street lamps erected (oil)	525
Total number of street lamps in the city	21,546
Street lamps repaired	45,737
Number of buildings removed	935

MAPS AND PLATS MADE.

For new subdivisions	220
For opening, widening and vacating streets and alleys	176
For special assessments, street and law departments	2,724
For miscellaneous purposes	151
Total	3,271

TOTAL ASSESSMENTS PREPARED.

For improvement of streets and alleys	229
For private drains	121
For water service pipes	132
For street and alley openings	6

Digitized by Google

For new sidewalks	214
For gas lamps	117
For oil lamps	47
Total	866

MISCELLANEOUS.

SPECIAL IMPROVEMENTS.

Dredging the Chicago River and its branches.

Constructing Indiana Street Viaduct.

Building engine-house for fire-boat at the foot of La Salle street.

Constructing swing bridge over Chicago River at Eighteenth street.

Constructing swing bridge over Chicago River at Jackson street.

Building engine-house for Fire Department on Oakley avenue, northeast corner Thirteenth street.

Building shop and patrol barn for Police Department on Union street, corner Eagle street.

Constructing swing bridge over Chicago River at Dearborn street.

Constructing swing bridge over Chicago River at State street.

Building fire engine house at Nos. 77 and 79 Illinois street.

Digitized by Google

Constructing viaduct over railroad tracks on Jackson street, at the river.

Machinery for operating Jackson street, Madison street and Randolph street bridges.

New lake-water tunnel for new Pumping Works.

Constructing a breakwater around Lake Tunnel Crib.

Police station building, Nos. 958 and 960 North Halsted street.

Constructing new bridge over the river at Wells street.

Constructing viaduct on Eighteenth street and the river.

CONTRACTS.

The contracts entered into by the city for various kinds of material and the construction and completion of public improvements carried on under the direction of the Commissioner of Public Works, shows an expenditure of $3,741,900.94, as follows:

147	street and alley improvements, aggregating	$1,071,776	97
19	for curbing, filling and grading streets, aggregating	41,578	60
101	for water service pipes, aggregating	65,442	71
95	for private house drains, aggregat'g	31,284	38

Digitized by Google

1	for sweeping and cleaning improved streets, aggregating	$84,298 88
15	for constructing bridges and viaducts, aggregating	585,626 75
10	for maintenance of water system, aggregating	71,699 84
4	for cast iron water pipe, aggregat'g	360,477 54
21	for constructing sewers, aggregat'g	145,724 91
6	for oak and pine lumber, aggreg'g	30,837 50
5	for constructing engine houses and police stations, aggregating.....	50,172 00
2	for dredging Chicago River and its branches, aggregating.....	29,036 42
6	for coal for Pumping Works, City Hall, etc., aggregating.....	284,145 00
4	for street lamp posts, aggregating	16,249 44
1	for floor tiling at North Pumping Works, aggregating.....	1,050 00
1	for tug service during winter to Lake Crib, aggregating	3,150 00
1	for constructing breakwater around Lake Crib, aggregating.....	119,000 00
1	for constructing new water tunnel and shafts, aggregating.....	750,000 00
1	for miscellaneous work, aggregating.....	350 00
	Total.....	$3,741,900 94

FINANCIAL.

Statement showing the amount appropriated by the City Council, and amounts from other sources to be expended for public improvements under the supervision of this Department, for the year 1887 :

Balance January 1st, 1887, to credit of water, sewerage and general appropriation and City Hall funds	$1,530,735 75
From general appropriation for 1887	1,544,871 71
From rent and interest	26,335 08
From street lamp and other funds	107,139 92
From private parties, money advanced	40,709 00
From water revenue, including tapping permits	1,526,265 63
From drain permits and drain layers' licenses	36,222 40
From railroad companies on account of viaducts and bridges	31,835 55
From private parties for labor and material	120,917 07
From house moving permits	3,183 00
From vouchers deposited back, and miscellaneous items	3,085 26
From special assessments	3,160,474 67
Total	$8,131,775 04

Digitized by Google

Of this amount there has been expended as follows:

From general appropriation, sewerage and City Hall Funds in 1887. For bridges and viaducts, dredging, street cleaning, public buildings, tunnels, Canal pumping works, Fullerton avenue pumping works, parks, work for private parties, salaries, City Hall, constructing and maintaining sewers and catch-basins.....		$1,718,730 86
For water supply, pipe extension	$343,550 12	
For private work by meter department..	58,598 76	
For extension of North Pumping Works....	37,788 17	
For water and drainage commission.....	22,701 45	
For new shore inlet...	18,373 02	
For maintenance of water system, operating pumping works, cost of collecting taxes and miscellaneous items.....	657,447 85	
For interest on water loan bonds.....	264,374 50	

Digitized by Google

For real estate.....	$57,220 31	
For investment in city bonds.....	343,280 00	
For street improvements, street openings, sidewalks, private drains, water service pipes and lamp posts.....	1,358,889 47	
For rebate (excess of assessments over cost of improvements), abatements to property owners doing their own work, land damages and assessments held over and annulled by Council.	1,801,585 20	$4,963,808 85

BALANCE.

December 31, 1887, to credit of water, sewerage, City Hall and general appropriation funds.....	1,449,235 33
Total.....	$8,131,775 04

WATER WORKS.

Much time and careful attention have been given to a study of the management and control of the water works system of the city. Soon after entering upon his duties it became evident to the Commissioner that strict business principles had not prevailed in the management of the several branches of this Department. Insubordination and inefficiency predominated, especially at the North Side Pumping Works, and there seemed to be no attempt toward an economical administration of affairs. Purchases had been and were being made in open market without regard to competition in prices, and if any rules or regulations regarding the subject of supplies had ever been adopted, their observance had been and was being ignored. The books at the works could not be made intelligible at the hands of an expert and the task had to be abandoned as hopeless. To bring order out of the chaos it became necessary to discharge some of the men, and among the number were several of the oldest attaches of the service. But they had grown lax and careless and were wedded to neglectful habits which could not be tolerated, as the public interest was suffering at their hands. Their places were filled with new and efficient men, and a new order of things was instituted, business methods were adopted and a strict adherence thereto was enjoined upon all. The

Digitized by Google

result has proved very beneficial to the city, as can be seen in the bearing of the employes, the condition of the accounts and the harmony which everywhere prevails.

Later in the year I became satisfied that mismanagement prevailed in the mechanical department of the water supply system. Bills for repairs were frequent and of such magnitude as to warrant an investigation, for which purpose the services of qualified men were secured. Their report was of a nature that I deemed it advisable to submit the same to his Honor, the Mayor, who regarded it of such importance as to require his immediate action. The result was the employment of a mechanical engineer of known ability, in the person of F. W. Gerecke, who was given instructions to make a thorough examination of the various pumping works of the city, his attention being first directed to the condition of the North Side Works. His report revealed a startling state of affairs. The details will be found on page 192 of this report. The West Side Works are undergoing a similar examination.

Radical changes have also been made in the Water Collection Department, economical methods adopted, and the result is a large increase in the collections over those of the preceding year, at a decreased expense. For details see the report of Superintendent T. N. Bond, page 227.

Digitized by Google

During the year the supply of water has been of good quality, but deficient in quantity. The latter difficulty will be remedied for the time being, however, as soon as the North Side pumps can be put in proper shape; but then the city will be confronted by the fact that the capacity of the present tunnels has been about reached.

Appreciating this last named condition, the Department has during the year extended a new tunnel 1500 feet into the lake, to take the place of the old shore inlet. From this point, in case of emergency, an ample supply of water can be had, but it will not be used, except in extreme cases. In other words, it was built as a precautionary measure, and to put the city in position to meet a contingency. Before another report is submitted, however, a new water tunnel, which has been talked about for so many years, will be far advanced in construction, starting from the vicinity of Twelfth street and extending four miles east, the west or shore end connecting, at a point near Harrison street, with the old cross-town tunnel which supplies the West Side Pumping Works. It is also expected that during this year a protection will be built around the "Crib," which will remove the danger from ice and exposure.

NORTH PUMPING WORKS.

(FOUR DOUBLE AND TWO SINGLE ENGINES.)

An investigation of the condition of the North Pumping Works has developed a total inability of the engines to perform the service equal to their required capacity, and that at no time for several years past have they furnished the city the quantity of water accredited to them, while the cost and expense of maintaining and operating the same has been nearly equal to the amount required had the engines and pumps performed their full duty. The cost of pumping and other expenses at these works, including coal and stores on hand, general repairs, etc., for the past year, was $135,726.88.

WEST PUMPING WORKS.

(FOUR ENGINES.)

The quantity of water pumped during the year was 20,045,528,600 gallons, being an average of about 54,919,256 gallons per day under a head of 97.3 feet.

Expenses due to pumping are	$90,849 78
Other expenses at these works	1,997 65
Total expenditure	$92,847 43

Digitized by Google

PIPE SYSTEM.

Water pipes were laid during the year as follows:

Four (4) inch	9,653 feet.
Six (6)	129,673 "
Eight (8)	59,383 "
Twelve (12)	15,553 "
Sixteen (16)	16,956 "
Twenty-four (24)	2,690 "
Thirty-six (36)	106 "
Total	234,014 feet.

The whole being equal to 44.32 miles. Small pipe taken up and abandoned 2.01 miles; net pipe added to the system during the year, 42.21 miles—a total of 638.23 miles of pipe laid in the city at the close of the year.

Fire hydrants placed in position during the year	577
Hydrants taken out and replaced by others of different sizes	28
Net number of hydrants added to the system.	549
Total number of fire hydrants now in use	5,899
Stop-valves put in place during the year	317
Stop-valves taken out and replaced by others of different sizes	13
Net number of stop-valves added to the system.	304
Total number now in use	4,736

Digitized by Google

WATER METERS AND ENGINES.

Number of meters put in during the year.....	249
Number of meters removed during the year...	61
Net increase.....	188
Total number of meters now in use.....	3,273
Number of elevators and other water engines supplied during the year.....	3
Total number of water engines now in use....	381

The revenue derived from water measured by these meters and engines for the past year amounts to $499,233.95, an increase of $23,452.91 over the amount collected from the same source last year.

Under the various ordinances and orders of the City Council, amounts have been rebated on water rates during the past year as follows :

On educational, religious and charitable institutions, under ordinance of November 21, 1884	$12,678 65
Municipal and Board of Education, under ordinance of July 30, 1885	16,016 11
On private residences by various orders passed by the City Council	248 00
Total amount rebated	$28,942 76

SEWERS.

The sewerage system has been extended in the various divisions of the city during the past year as follows:

Constructed in the West Division	12.400 miles
Constructed in the South Division	4.200 "
Constructed in the North Division	0.552 "
Total	17.152 miles

Number of catch-basins built	756
Number of sewer man-hole chambers built	605

Digitized by Google

The cost of constructing sewers and catch-basins during the year was as follows:

West Division	$128,632 62
South Division	48,641 35
North Division	7,303 07
Total	$184,577 04

Total number of miles of sewers in the city December 31, 1887	472.48
Total number of catch-basins	15,234
Total number of man-hole chambers	16,903

MAINTENANCE.

The total cost of cleaning and repairing the sewers, the cost per mile, and number of miles; also the number of catch-basins and man-hole chambers distributed in the three divisions of the city, is as follows:

DIVISIONS.	MILES OF SEWERS.	NUMBER OF CATCH-BASINS.	NUMBER OF MAN-HOLE CHAMBERS.
West	263.47	8,330	9,371
South	129.63	4,301	4,669
North	79.38	2,603	2,863
Totals	472.48	15,234	16,903

Digitized by Google

There was expended for repairs during the year $11,810.54, being an average cost of $24.99 per mile.

There was expended for cleaning, $50,264.00, making the average cost $106.39 per mile.

The total cost of both repairs and cleaning was $62,075.19, an average cost of $131.38 per mile.

Of the 472.48 miles of sewers constructed, 239.787 miles are of brick and 232.693 miles of vitrified pipe.

TOTAL COST OF SEWERS, ETC.

DIVISIONS.	MILES.	COST.	AVERAGE COST PER MILE.
West	263.47	$3,848,472.69	$10,811.37
South	129.63	1,868,067.97	14,410.76
North	79.38	1,229,383.79	15,487.32
Totals	472.48	$6,945,924.45	$14,700.99

BONDED SEWER DEBT.

Sewer Bonds outstanding December 31, 1887, bearing 7 per cent. interest and maturing as follows:

July 1, 1888	$343,000 00
July 1, 1889	44,000 00
July 1, 1892	490,000 00

July 1, 1904, bearing 4 per cent. interest	458,000 00
Total	$2,622,500 00

RIVER IMPROVEMENT BONDS.

Bonds outstanding December 31st, 1887, bearing 7 per cent. interest and maturing as follows:

July 1st, 1890	$ 250,000 00	
" " 1892	249,000 00	
" " 1893	500,000 00	
" " 1894	346,000 00	
" " 1895	1,263,000 00	
		$2,608,000 00
Grand total outstanding		$5,230,500 00

Total interest paid on sewerage bonds to January 1st, 1888	$4,579,468 50
Total amount paid as interest on river improvement bonds to January 1st, 1888	$3,579,620 00
The whole amount paid as interest on water, sewerage and river improvement bonds, combined	$14,357,972 92

Digitized by Google

THE RIVER.

The river has not received the attention its importance to commerce would seem to demand, for the reason that the appropriation was entirely inadequate to justify any extended work in the way of dredging. Statistics show that during the year more than 24,000 vessels, with a tonnage of over 800,000,000 tons, arrived and departed, and I have no doubt that the aggregate would have been larger but for the fact that the river has been at times unnavigable in certain places. The vessel Interest has complained from time to time, and by petition to your Honorable Body has shown what the absolute condition is. So it is unnecessary to go into details.

In my opinion, the river is second only to the railroads in the business development of the city, and until something is done to build and maintain an outer harbor, its care should be provided for, from year to year, by liberal appropriations. It should be kept navigable to the largest vessels all the time. With the sewers and more or less of the malarial accumulation of filth and *debris* incident to a great commercial center emptying into it, this can only be done by persistent dredging. No pains have been spared to prevent foreign matter finding its way into the river, both in the interest of protecting the city's water supply and saving the river from filling, but its con-

Digitized by Google

dition has been such, notwithstanding, as to justify the complaints of vessel owners and persons having lake-traffic interests. I cannot, therefore, too strongly urge that every attention be given to the subject, that the city may not only retain the commerce it has, but invite that which it has not.

RIVER LIGHTING.

With the view of furnishing sufficient light to make safe the transfer of shipping at night, and also providing greater light power at bridge approaches, viaducts and street ends—the most dangerous portions of our public thoroughfares—an agreement was entered into with the Western Electric Company, of this city, to provide and construct a plant of 100 arc lights of 2,000 candle power capacity, complete, in working order, for the sum of $29,295; the plant to be located in the basement of the quarters of Chemical Engine Company No. 1, at the corner of Clinton and Washington streets; the lights to be distributed on the various bridges, viaducts and street ends, extending to Taylor street on the south, Kinzie street on the north and Rush street on the east. In accordance with this agreement the work was commenced and, on December 24th, 1887, the plant was started with 18 lights. As far as weather and circumstances would permit, the work has been pushed, and in a short time will be

Digitized by Google

completed. At present there are about 80 lamps in position and all expectations have been realized. The river, bridges, viaducts and street ends are brilliantly lighted, thereby obviating danger at bridges and fully permitting navigation at night. I would recommend its further extension on the river and to the principal business streets.

BRIDGES AND VIADUCTS.

The cost of maintaining these structures for the year was as follows:

For general repairs of bridges and viaducts	$81,460 32
Of this amount there was received for labor and material, and from vessels for damage to bridges	9,206 26
Total cost to city for repairs of bridges and viaducts	$72,254 06

During the year a new bridge was built at State street. It is first-class, so far as material and construction are concerned, but it would have been much better to have had a double roadway. The bridge was built, however, to meet an emergency, and the understanding is that at some future time it will be transferred to another point, and a double bridge put in its place.

Digitized by Google

New bridges of modern design are in process of construction at Wells street, Jackson street and Eighteenth street, and steam power is being applied to Randolph street and Madison street bridges.

Plans for the construction of viaducts over the tracks of various railroads entering the city are in preparation, and it is probable that at least ten or a dozen of these much-needed structures will be completed by the close of the year, at the expense of the railroad companies.

The telephone system at the bridges has proven a success, and is so admitted, even by those who inveighed most against it when adopted.

Under instructions from the Department, all the bridges and viaducts have been specially examined by the engineering bureau, and the result has demonstrated the necessity for the immediate repair of many that had not received proper attention. Some of them are classed in the report of the engineer under the head of "dangerous."

NORTH BRANCH RIVER PUMPING WORKS.

The past year 6,518,352,650 cubic feet of water were forced from the lake into the river at the Fullerton avenue works, at a cost for operating and maintenance of $15,290.66. No water was pumped from the river into the lake during that period.

Digitized by Google

SOUTH BRANCH RIVER PUMPING WORKS.

These works performed their duty in a satisfactory manner, continuously, through the year, excepting when the river was swollen by freshets. The total cost of operating them was $43,698.92.

OGDEN DAM.

This improvement has not required any extensive repairs since the general reconstruction and extension in 1886. There was expended for maintenance during the past year only $229.25.

TRAFFIC TUNNELS.

There was expended for maintenance and repairs on these tunnels, the past year:

For the Washington street tunnel.....	$2,473.51
For the La Salle street tunnel.....	1,875.87

The condition of the Washington street tunnel remains essentially the same as last year. The sum expended was for improving the roadway, and for temporary repairs, which were necessary to place the passage-ways in passable condition. No extended permanent repairs will be undertaken, pending acceptance or the taking possession of the tunnel by

Digitized by Google

the Chicago Passenger Railway Co., under the ordinance passed February 8, 1886. Occupancy by it, will require extensive changes and partial reconstruction to place the tunnel in condition to accommodate street-car traffic.

The amount expended on the La Salle street tunnel includes only the cost of maintenance and repairs for the portion of the year ending September 10, 1887, at which date the North Chicago Street Railroad Co. took formal possession of it, and commenced the necessary repairs and the laying of the cable tracks, under the conditions of the ordinance of July 19, 1886, which releases the city from further expense connected with the improvement or maintenance of this tunnel.

STREETS.

The year was one of great activity in the Street Department, as will be seen by reference to the work done. The fact that the former administration, in its anxiety to make elaborate exhibits, had left the city a debt of over a quarter of a million dollars for paving street intersections, was an early embarrassment, for, in providing for this, the Council was limited in its appropriations. But the best possible use was made of the money at the Department's command. Contracts were let at favorable prices—the result of insisting upon wide competition—and the character of

Digitized by Google

the improvements will more than favorably compare with those of former years. The tendency is toward the greater use of the more permanent material. This should be encouraged, so that in a few years all the great thoroughfares of the city will be paved with granite, or some other substance more durable than the old-time wooden block. Special reference to the use of more permanent material is prompted by the belief that it is destined to be much cheaper than it has been.

The great objection to stone pavement has been the cost. My experience as to this, may not be uninteresting, since it sustained the objection. When I took charge of the Department, the bids were limited to four qualities of granite, from which selections were made, and these four were controlled by two parties. Believing this caused combinations, and, consequently, high prices, I had a large number of samples of granite offered as paving material, critically examined, and the result was the placing on the list of those which proved acceptable—*eleven*, instead of four, and prices fell *twenty per cent.*

It was natural to expect, with the growth and development of the city, more or less complaint about the tearing up of streets, but I think your Honorable Body, and the public at large, will recognize the fact that this inconvenience has been kept at a very low minimum, as compared with preceding years. I have given this matter personal attention, and made every

Digitized by Google

effort to lessen complaints. When permits have been issued (and this is a matter largely controlled by ordinances, and in which the Department has no discretion) for tearing up the streets, every reasonable condition has been imposed in the interest of the public. The former custom of giving permits, allowing half a dozen streets to be torn up at the same time, and in a half dozen different places, has been abandoned, and the various gas, telephone, electric light and other companies have been compelled to open only one block at a time. All such work is done at night, so far as possible, and the result has been quite satisfactory. In other words, the attempt of this Department to preserve the streets without placing an embargo on individual or corporate enterprise, has been successful.

During the year streets were improved as follows:

Paved with cedar blocks	31.13	miles.
" sheet asphalt	0.22	"
" macadam	1.91	"
" asphalt blocks	0.25	"
" granite blocks	2.85	"
" cinders	0.44	"
" iron	0.05	"
Total number of miles improved	36.85	miles.
In addition to the above, streets were planked for a distance of	1.56	"
Making a total of	38.41	"

For lighting and maintenance by the Co	6 74
For new lamps and repairs by the city.....	1 05
Total.....	$23 18

Cost of maintaining each oil lamp per month, as per contract..... $1 80

PARKS.

The city is possessed of a series of small parks, in which I feel deep interest. They are located with a view to being made a resort for children and families, but somehow, it seems to have been the policy to give them very little attention. The appropriations for their maintenance have been barely sufficient to pay for attending them, whereas they should be made beauty spots, and to the citizen what the outlying parks are to visitors. They should be adorned with flowers and shrubbery, and no effort spared to make them attractive to the eye and pleasant to visit. Money used in this direction is wisely expended, for parks are educators after all, and to none more than the large class who are unable to get away from the smoke, dust and noise of the great city, and who seldom, if ever, get even a glance at the beauty, grandeur and wisdom of nature, as revealed in the trees and flowers.

Digitized by Google

The Lake Front Park demands special attention. Nestled by the side of the great lake, if it abounded with shade trees, flower-gardens, walks, fountains and comfortable seats, and enjoyed proper police surveillance, it would be a resort for thousands of people, and an ornament to the city.

I trust your Honorable Body will weigh these suggestions and exercise your best judgment in the treatment of the city parks.

The cost of maintaining the various public parks under the control of this Department during the past year, was as follows:

Lake Park	$2,169 57
Ellis Park	1,033 02
Douglas Monument Square	834 01
Aldine Square	694 99
Campbell Park	188 00
Union Square	185 25
Washington Square	1,747 69
Holstein Park	575 40
Total expenditure	$7,427 93

COMPARISON WITH FIVE PREVIOUS YEARS.

1882.....	3,113	73,161	13.8	$19,803,500 00
1883...	4,086	85,588	16.2	21,875,000 00
1884.....	4,169	98,782	18.6	25,862,000 00
1885.....	4,638	108,850	20.6	24,339,875 00
1886.....	4,651	113,144	21.2	27,040,382 50
1887.....	4,833	115,506	21.8	19,778,100 00
TOTALS FOR 6 YEARS	25,490	595,031	112.2	$138,698,857 50

There were moved under the supervision of the Department of Public Works, 878 frame, and 57 brick buildings, a total of 935. They varied from one to three stories high and extended over a surface of 18,086 lineal feet, or $3\frac{3}{5}$ miles of frontage.

CONCLUSION.

Having presented in brief a statement relating to the principal public improvements undertaken the past year and the cost of the same, together with the distribution of the funds appropriated and at the disposal of this Department, I take pleasure in inviting your Honorable Body to an examination of the following itemized reports of the heads of the various bureaus.

Yours respectfully,

GEO. B. SWIFT,

Commissioner of Public Works.

ENGINEER'S REPORT.

CHICAGO, March 1, 1888.

HON. GEO. B. SWIFT,

Commissioner of Public Works.

DEAR SIR:—I submit herewith the Twelfth Annual Report of the Bureau of Engineering under the Department of Public Works, being for the year 1887.

WATER SUPPLY.

In former reports it has been customary to give tables setting forth all the particulars connected with the water supply, but at this time it is impossible to do so with any degree of certainty.

Due credence is still given to the records of the West Pumping Works, but expert examination has developed the fact that at the North Works the amount of water pumped has been greatly overrated.

On the 29th of November Mr. T. T. Johnston, Assistant Engineer, was detailed to make an examination of the pumps at that Station.

Digitized by Google

An examination of the north or '67 engine demonstrated that, owing to the cylinder and valves being badly worn, the pumps were not doing more than one-half of what they should do, and that a great deal of water was lost when the engine was idle by leakage from the mains through the pumps back into the well.

The pumps were at once bored out and new valves and packing put in, and general repairs made; they are now working in a fairly satisfactory manner.

The '72 or south engine was next examined and also found to be in a very unsatisfactory condition. Exhaustive reports of the condition thereof have been furnished you.

The tables concerning the pumpage of the West Works are given as received, but no total quantity for the combined works nor general average can be given for the reason already stated.

Mr. Johnston's report is inserted in full with the other reports from the North Station.

The Holly engines were completed and put in operation in June.

They were subjected to a formal test under the direction of a Board of Experts consisting of Messrs. Thurston, Coon and Warrington, whose reports have been furnished you.

WEST PUMPING WORKS.

CHICAGO, February 1, 1888.

To the City Engineer, Chicago:

DEAR SIR:—The twelfth annual report of the operation of these works, being for the year ending December 31, 1887, is herewith submitted.

During the past year the four (4) engines located at these works have been pumping in a very satisfactory manner. The two old, or 1876, engines were shut down for two weeks, alternately, during the months of October and November, and were thoroughly overhauled; otherwise the engines were run very steadily during the year.

BOILERS.

The boilers are at present in good condition; the old boilers have been in constant use for the past twelve years, and during the year the tubes were taken out and repaired and the boilers cleaned throughout.

Assistant engineers Stewart, Commons and Sanborn, and clerk H. Bartels, and the other employes at these works, have been faithful in the discharge of their respective duties.

Respectfully submitted,

HENRY MASON,
Chief Engineer.

WEST PUMPING WORKS.

The following table shows the total quantity of water pumped and the hours run by the four (4) engines, respectively:

Engines Designated as	Hours Run. HOURS. MIN.	Revolutions Made.	Gallons of Water Pumped Less 5⅔ per cent. for Loss of Action.
No. 25.	7,758.10	4,829,905	4,829,905,000
" 26.	7,756.40	4,839,644	4,839,644,000
" 50.	8,441.40	4,895,389	5,189,112,340
" 51.	8,455.45	4,893,271	5,186,867,260
Totals.....	32,412.15	19,458,209	20,045,528,600

The total pumpage of 1887 is in excess of the pumpage of 1886 about 600,000,000 gallons.

NORTH PUMPING WORKS.

CHICAGO, March 3, 1888.

To the City Engineer.

SIR:—I have the honor to submit herewith the Thirty-fifth Annual Report of this station, for the year ending December 31, 1887.

No report of the water pumped for the year by these works can be given, as the records of the engines for the greater part of the year were based on the hypothesis that the engines were pumping their original capacity at each revolution, which has been demonstrated not to be a fact.

A report, showing *in extenso* the causes of the discrepancy between the accredited and actual work of each engine, and also showing, where possible, the approximate amount of work done by each engine has been already prepared and submitted to this bureau.

As the amount of the yearly pumpage cannot be had, it follows that no monthly nor daily pumpage or averages can be given, and the tables deduced therefrom (and which have always been the prominent feature in former reports), are *perforce* regretfully omitted.

On other matters I report as follows:

Digitized by Google

FUEL.

ANTHRACITE COAL.	TONS.	LBS.
On hand January 1, 1887	565	1,800
Received during year 1887	14,156	160
Used during year	14,105	775
On hand January 1, 1888	616	1,185

DISBURSEMENTS.

DISBURSEMENTS.	AMOUNT.
Wages and labor	$45,049.62
Coal	84,438.71
Lubricators and lard oil	1,017.75
Waste	273.64
Packing	103.91
Supplies	644.94
Gas	1,159.20
Repairs of engines	1,251.88
Repairs boilers	228.46
Buildings and grounds	1,110.17
Miscellaneous	93.13
Share of stable expense	360.47
Total	$135,726.88

GENERAL ITEMS.

BUILDINGS AND GROUNDS.

The buildings are in fairly good condition, but need considerable cleaning and painting.

The grounds are in good condition, but there is much necessity for a substantial sidewalk around them, as the present affair—a cinder walk—is almost entirely submerged in wet weather, and at such periods can not be used.

Digitized by Google

NEW ENGINES.

In June two new Gaskill pumping engines, with a daily capacity of 24,000,000 gallons, were put in operation. In October the same were tested by a board of expert engineers with successful results. These engines are running now and in a satisfactory manner.

OLD ENGINES.

The '53 engine is still pumping, but from long usage is hardly fit to be continued in service.

The '57 engine, considering its age, construction and service is doing good work.

The '67 engines have been thoroughly overhauled, the pumps bored out (and consequently somewhat enlarged in capacity), and are now running in a fairly satisfactory manner.

The '72 engines have been in a very deplorable state of repair which has much interfered with their usefulness. They are now undergoing thorough repairs.

BOILERS.

The north boiler, in the north boiler room of the old engine house—placed in position in 1867—and which has been mentioned in former reports as unfit for use, is still in service, in a much-emphasized bad condition. To replace it are needed a boiler or boilers of modern construction. All the boilers in the old

Digitized by Google

works have been subjected to long use, but attention is most particularly directed to this one.

SHOP.

On account of the great increase in the demand for the products of the workshop, the latter in its present condition is unable to keep up in its work. The enlargement of the shop and the placing of new and modern machinery in it are recommended; in particular, the purchase of a planer or shaper seems a necessity.

SHOP RETURNS FOR THE YEAR.

	CHARGE.	EXPENSE.
Total expenditure, including stock on hand January 1, 1888		$35,821.02
Outstanding liabilities—Castings		3,792.02

24 in. valves	2	2	2
Total	60	65	870

STABLE.

The building is in good condition and the horses and different vehicles are in a satisfactory state. During the year the unsuitable horses have been disposed of and better ones purchased in their place.

Very respectfully, your obedient servant,

HENRY WELCH,

Chief Engineer North Pumping Works.

Digitized by Google

CHICAGO, January 19, 1888.

MR. WM. R. NORTHWAY,

Acting City Engineer.

DEAR SIR:—The following is a statement of the condition in which I found the "North" or '67 pumping engine at the North Side Pumping Works, at the time the repairs (now nearly completed) were commenced:

The pistons in the pump-barrels were of too small diameter, allowing considerable water to pass them.

The water-valves were in very bad condition; of the seventy-two (72) small double-beat valves none of them took either the top or bottom seat fairly, the rule being to touch at the three points on the lower seat and not at all on the upper seats. In one case I noticed one-eighth (1/8) of an inch between the upper face and its seat when the lower face rested on its seat. Of the eight (8) large double-beat valves, half of them were in fair condition, two others badly worn, and two others worn out. These valves have wooden seats, all of which had to be renewed. In those valves most badly worn the wooden seat was gone in places, so that a lead pencil could be inserted in the apertures.

The pump-barrels were so badly worn that they had to be bored out, in order that a piston, properly made, may work effectively. The barrel of the north pump was found to be so much out of its proper

Digitized by Google

alignment that a properly made piston never could have worked effectively.

The steam end of the machine was, all things being considered, in reasonably good condition, though needing ordinary repairs.

I have possession of a set of cards taken in July, 1887, giving 210 indicated horse-power when making ten (10) revolutions. If the engine had been in good order there should have been about 350 indicated horse-power. As it was, it is not probable that the effective work of the machine was more than one-third of its capacity.

This pump was usually allowed to stand idle during the night, and at such times a very large amount of water must have passed from the water mains through the valves and into the pump well.

Very respectfully,

THOS. T. JOHNSTON,

Assistant Engineer.

WATER PIPE EXTENSION.

The amount of water pipe laid during the year is far in excess of any previous year, the net increase being about 42¼ miles.

Of this amount nearly 10½ miles was laid in Section 36, formerly a part of the Town of Jefferson.

Property owners have advanced the money to lay 26,987 feet of pipe on streets where but little or no revenue is derived at present. Such money will be refunded when the required revenue is received.

We have taken up or abandoned 11,129 feet of pipe and have replaced it with pipe of larger size.

The total amount of pipe of all sizes in use by the city on December 31, 1887, is 638$\frac{1238}{5280}$ miles.

We have in service, in connection with the system, 4,736 stop valves and 5,899 fire hydrants.

Fire cisterns were built during the year as follows:

At intersection of State and Jackson streets.

At intersection of Adams and Dearborn streets.

At intersection of Lake and La Salle streets.

At intersection of Lake and Franklin streets.

At intersection of Lake St. and Michigan avenue.

Water mains heretofore laid have been lowered to a depth of five and one-half feet below the established grade on the following streets:

Indiana avenue, from Thirty-third street to Thirty-fourth street.

Digitized by Google

Indiana avenue, from Thirty-seventh street to Egan avenue.

Prairie avenue, from Thirty-third street to Egan avenue.

Forrest avenue, from Douglas avenue to Thirty-eighth street.

Thirty-seventh street, from Grand boulevard to State street.

Jackson street, from Halsted street to Aberdeen street.

Jackson street, from Loomis street to Laflin street.

Sheldon street, from Fulton street to Carroll street.

RIVER AND DREDGING.

As much dredging has been done during the year as the appropriation would admit of, but a good deal more is needed to make all parts of the river channel passable for boats of more than average draught.

The mean level of the water in the river has been six-tenths (0.6) of a foot below that of 1886, and from the experience of former years it is likely to be still lower during the coming season; in which case a large amount of dredging will be required to keep the channel passable for anything but the smaller craft.

The following tables show the height of water in the river and in Lake Michigan during the year 1887.

GRANITE PAVING BLOCKS.

In view of the fact that heretofore there have been only some four or five kinds of granite from available quarries in use, or rated as standard for paving purposes, it may be of interest to insert the report made by the City Engineer by the direction of the Commissioner of Public Works on the quality of a number of varieties presented by different parties.

The effect has been to place in competition upwards of a dozen sources of supply instead of four or five, and to materially lessen the price of granite paving.

Since the report was made several specimens of Wisconsin granite have been examined and passed as first-class.

CHICAGO, June 9, 1887.

GEO. B. SWIFT, ESQ.,

Commissioner of Public Works.

DEAR SIR:—In response to your inquiry as to the merits of several samples of granite submitted for street paving blocks, I beg to report as follows:

For this purpose it is desirable that the stone should be not only hard and durable, but it should not wear smooth and acquire a polished surface. Smooth wear is a great practical objection to the use of excessive hard stones. Generally the hard and most durable granites possess the fault of slipperiness when set in

Digitized by Google

pavements. The less durable granites wear roughly, and therefore afford a better foothold for horses; hence it is that for the sake of public convenience the hardest and most durable granites are not as satisfactory. Nothing short of actual experience under traffic can determine the behavior of some of the stone, for the durability under traffic, the tendency to wear round rather than flat, and to become slippery are dependent upon no conditions which can readily be foreseen. The size and distribution of the crystals, the nature and hardness of the constituent minerals operate in such a manner that two opposite combinations often produce nearly the same result, while rocks of nearly the same hardness frequently behave very differently under traffic.

I have classified and numbered the stone preserving the same characteristic as near as possible under the proper head.

CLASS A.

No. 1. Head Island.— Minerals well distributed, crystals small, the stone soft. Will make a good pavement where traffic is not heavy, and on approaches to bridges, etc., but not very durable.

CLASS B.

The following stones I consider will make a good, durable pavement for general purposes, and will not wear smooth under traffic:

Digitized by Google

No. 2. Warsaw.

3. Jaickes and Thatcher.

4. Hurricane.

5. Thousand Island.

6. Montello.

7. Marinette.

8. St. Cloud.

8½. Mesaba.—In this stone the quantity of mica is large but well distributed, and appears to be more in the form of crystals than any of the preceding. It deserves a trial.

CLASS C.

In the following stones the quantity of mica is large, and is distributed in the form of pockets. Will probably not be a durable stone, and caution should be used in adopting it for general purposes.

No. 9. Forsyth.

10. Sullivan.

11. John McAdam.

CLASS D.

No. 12. Green Lake.—Is a harder and more durable stone than any of the preceding, in use. The edges do not break off and the stone become round, but the surface wears smooth. It is a good stone.

CLASS E.

No. 13. *Berlin.*—A laminated stone, utterly useless as a paving stone.

Digitized by Google

CLASS F.

Hard, brittle stones; will chip off on the edges, wear round on the surface, and become polished under traffic; is useless for pavement.

No. 14. Sioux Falls.

15. Devil's Lake.

Respectfully submitted,

SAM'L G. ARTINGSTALL,

City Engineer.

BRIDGES AND VIADUCTS.

During the year 1887 the following named work has been done:

Twelfth Street Bridge was completed and opened for traffic in June.

The West Twelfth Street Viaduct was opened at the same time, and the Lumber Street approach to said viaduct was completed early in September.

The plan of these structures with the estimate of cost was given in the report for 1886.

STATE STREET BRIDGE.

This structure was completed and opened for traffic in August.

It is a single roadway steel bridge, turned by steam, and is a first-class structure of its kind.

The cost was as follows:

Superstructure	$24,440 00	
Engine and Machinery	2,942 00	
Sundry items	5,591 61	
Total		$32,973 61

JACKSON STREET BRIDGE AND VIADUCT.

The center pier, east abutment and protection for this structure are completed, and considerable work has been done on the viaduct approaches and piers.

Contracts have been let for the superstructures of both bridge and viaduct and it is expected that the structure will be open for traffic July 1, 1888.

The cost of the bridge may be summed up as follows:

Substructure	$49,806 67	
Superstructure	76,500 00	
Engine and Machinery	4,526 00	
Inspection, superintendence, etc	800 00	
Total		$131,632 67

The cost of the viaduct will be approximately as follows:

Portion of substructure contracted for	$83,895 00	
Changes in sidewalks, water pipes, sewers, catch basins, lamp posts, brick area wall in Canal street, superintendence, inspection, etc	52,605 00	
Superstructure	75,700 00	
	$212,200 00	
Less amount to be paid by R. R. Co	74,600 00	
Total		$137,600 00

Digitized by Google

EIGHTEENTH STREET BRIDGE AND VIADUCT.

The center pier, abutments and protection of this bridge are nearly complete, and the substructure of the viaduct is well under way.

Contracts have been made for the superstructure of both bridge and viaduct, and structures will probably be completed about May 1st.

The C. & W. I. R. R. Co. pay for one-sixth of the center pier and all of the east abutment of the bridge, and the interested railroads pay the entire cost of the viaduct.

An approximate estimate of the cost is as follows:

Cost of center pier, abutments and protection (est.)....	$45,000 00	
Superstructure.....	21,500 00	
Superintendence and inspection.....	800 00	
	$67,300 00	
Of which the R. R. Co. will pay (est.).....	12,000 00	
City's portion.....		$55,300

The estimated cost of the viaduct is as follows:

Substructure.....	$28,000 00
Superstructure.....	83,466 00
Changes in water pipe, sewer, gas main, inspection and superintendence.....	3,000 00
Total.....	$114,446 00

All paid by the Railroad Companies.

Digitized by Google

Digitized by Google

Digitized by Google

The substructure for Dearborn Street Bridge is nearly completed, and as soon as the North Chicago Street Railroad Company can operate their cable through La Salle Street Tunnel the bridge at Wells street will be removed and placed at Dearborn street.

This work is all to be done at the expense of the Street Railroad Company.

The viaduct at Indiana street has been very seriously delayed, in consequence of the Pittsburgh Bridge Company not having their material ready.

Arrangements are being made to turn the bridges at Madison street and at Randolph street by steam, April 1st being the date set.

The following report from Geo. R. Bramhall, Superintendent of Bridges, gives a statement of repairs made on bridges and viaducts by the Department during the year 1887:

CHICAGO, February 6, 1888.

W. R. NORTHWAY, ESQ.,

Acting City Engineer.

SIR:—Beyond keeping up the general repairs on the bridges and viaducts during the past year, not only from the increasing traffic over them, but from an unsually large amount of damages sustained by collisions from vessels and propellers, more renewing or more permanent improvements were put on them than in any previous year. Among the following

Digitized by Google

named bridges and viaducts will be found the largest share of what may be termed permanent improvements, or renewal.

State street center protection was mostly rebuilt and clumps of fender piles driven at each of the corners or angles, besides six or seven clumps were driven in the north draw to protect the new steel bridge while being built.

Clark street center protection was rebuilt, all of the west half with new piling and timbering, and fender clumps driven at each of the angles, and two clumps near the turntable in the north draw.

Additional piles were driven at the west approach of Lake Street Bridge, likewise at the south end of the center protection. A new brick bridge-house was built at the southwest corner of the west approach, afterwards moved across to the north side of the street on a new foundation; and a new and commodious bridge shop, for storage and tool-house, was built under the west approach.

On Randolph Street Bridge the old sidewalks were taken off, the beams cut off and reduced one foot in width, and rebuilt; all the iron work thoroughly cleaned and painted two coats; new clumps of fender piles were driven at each corner of the east approach; the south half of the center protection was rebuilt, and fender clumps driven on the corners of the protection; twenty cords of rubble stone were put inside

Digitized by Google

of the piling of the center pier, and bents put up under timbering in turntable and braced to strengthen it, and prevent it from swaying back and forth, and an additional chain with two wraps put on around the piling of the center pier, to strengthen the old piles.

The south end of center protection at Van Buren Street Bridge was rebuilt, and a large clump of fender piles driven on the southeast angle of the protection, and a new foundation put under the bridge-house.

The center protection at Twenty-second Street Bridge was rebuilt with all new timbering. Fifty piles were driven in the repairs of center protection and fender clumps. Both of the long approaches were re-planked, and a new foundation put under the bridge-house.

On the night of the 15th of July the Fuller Street Bridge was knocked several feet off the center, by a collision. After being replaced, all of the old flooring and timbers were stripped off, new stringers and flooring put on the roadway, all of the iron work cleaned and painted two coats, and sixty thirty-five-foot piles were driven for protection in the west draw and fenders for the west approach.

At Western avenue the bridge was raised and all the old timbering and planking taken out, new turn-table built and gear reset.

Indiana Street Bridge was rebuilt completely, except bottom and top chords and turntable, and all painted two coats.

Digitized by Google

After the east draw was dredged out in October, the east abutment settled down about nine inches and slid out in the channel about six inches, involving the necessity of driving heavy sheet plank, six by twelve inches and thirty-four feet long, close together to stop the outward movement.

A new foundation was built under the bridge-house.

Chicago Avenue Bridge was replanked; new and heavy bracing put on the pile bents on the east approach to resist the outward movement of the approach, owing to the bad condition of stone abutment and outward thrust.

North Halsted Street Bridge was replanked new, both of the approaches were replanked with two-inch travel plank, and additional long piles were driven in the fender clumps in the south draw.

Canal and Halsted Street Bridge was raised up, all of the timbering and planking in the turntable was renewed, and seven cords of rubble stone put in the piling of the center pier to strengthen the piling.

The bridge-house, like that of Lake street, had to be moved across to the west side of the street to accommodate some private improvement, and new foundation put under it.

East Division Street Bridge was replanked on new stringers.

The new bridge at West Division street was painted two coats, and clumps of fender piling driven in the east draw.

Digitized by Google

The center protection at North Avenue Bridge was rebuilt completely with new timbering and new piling, an outlay of over one hundred piles; both approaches were replanked and the bridge painted two coats.

Clybourn Place Bridge and bridge-house were given two coats paint.

Fullerton avenue bridge-house had to be moved across the street to accommodate some improvement.

At State Street Viaduct the roadway system was changed by substituting wooden girders and wooden beams in place of the iron I beams, and entirely rebuilt and well painted.

Randolph Street Viaduct was rebuilt completely except the iron work, which was thoroughly cleaned and all well painted.

Van Buren Street Viaduct was replanked and new sidewalks built.

The Twelfth Street Viaduct over the Burlington and Fort Wayne tracks was replanked on both roadways, and a sidewalk built on the approach to Lumber street, from the viaduct over the Wisconsin Central tracks.

At South Halsted and Sixteenth Street Viaduct new sidewalks were built, and all the old covering of the bottom chords taken off and renewed. The iron work was thoroughly cleaned and all received two coats paint.

At the Canal Pumping Works the grounds and road-

Digitized by Google

ways adjoining the boiler rooms were planked over to facilitate the unloading of coal, and to avoid the deep mud during heavy rains and breaking up from frosts.

Considerable work was done by this Department in the forepart of the season at the Bridewell, raising and shoving up settling brick walls of additional buildings in course of erection.

At Washington Street Tunnel the driveways were replanked with oak plank and storm doors put up and painted at each of the entrances of the foot passage.

A temporary fence was put up at the most exposed place of the north approach of the La Salle street tunnel, and a small building at the foot of La Salle avenue, to be used for a vessel dispatching office.

At Sangamon and Kinzie Street Viaduct new sidewalks were built, and all the iron work cleaned and painted two coats. The roadway was replanked diagonally with three-inch Norway pine plank; experience has proved that pine plank laid on in this manner will wear quite as long as oak, the cost being about one-fourth less, as can be seen at the Canal and Sixteenth Street Viaduct, which was replanked two years ago last Fall in the same manner, and has worn about equal with the oak at other places.

North Halsted and Kinzie Street Viaduct was all cleaned off and rebuilt, and the iron work all thoroughly cleaned and painted.

The channel bars in the bottom chords in both the

Digitized by Google

north and south spans of the structure, which is directly over the main passenger tracks, the web of the bars was found to be completely gone or destroyed by corrosion, nothing left of the bars in many places but the flanges; the result was that false bents had to be put up and the old channel bars taken out and new bottom chords put in the two spans.

This viaduct was built in 1873, being in use fourteen years. It may not be amiss to state that the bottom chords of the bridges and viaducts when exposed to the constant fumes of soft coal smoke from tugs and locomotives, deteriorates them to an alarming degree, and this waste is continually going on in the most vital parts of the structures. The bottom chords in Randolph Street Bridge, and others recently cleaned and painted, were found to be in a bad condition from the same cause. There seems to be no means of arresting this waste except by frequent cleaning and painting.

The cost of maintaining the bridges and viaducts the past year was $81,460.32; credit by old iron from old structures, $9,206.26; leaving actual cost at $72,254.06.

Respectfully submitted,

G. R. BRAMHALL,

Superintendent Bridges.

Digitized by Google

QUALITY OF WATER.

The quality of water has been good during the entire year, except perhaps in February, when, during a freshet, the crib was probably surrounded for a few hours with discolored water.

LAKE TUNNELS.

The lake tunnels continue in good order, but the continued enormous growth of the city renders a further water supply necessary in the near future.

A contract has therefore been entered into with Mr. Andrew Onderdonk for the construction of a new tunnel, to be eight feet in internal diameter and extend four miles eastward under Lake Michigan, together with the necessary connecting tunnels.

The contract extends through three and one-half years from date of contract.

LAKE CRIB.

It has been considered best, in view of possibilities, to add a protection to this structure in the shape of a breakwater, which will surround the present crib at a distance of thirty feet therefrom.

The contract for this work has been let to the Fitz-Simons & Connel Co., and the work is to be completed the coming season.

Digitized by Google

NEW INLET PIER.

Owing to a series of unforeseen delays, the work on this structure was not quite complete when the cold and stormy weather set in and caused a suspension of the work.

About two weeks will probably suffice for its completion as soon as the weather permits.

CHICAGO, December 31, 1887.

MR. SAMUEL G. ARTINGSTALL,

City Engineer.

DEAR SIR:—I herewith present the report of the number of water meters in use on the 31st day of December, 1887, also the number of hydraulic elevators, with the amount of revenue collected during the year 1887 for water measured by meters and used by hydraulic elevators and motors.

Respectfully submitted,

H. A. HAWKINS,

Superintendent Meters.

HYDRAULIC ELEVATORS.

Number in use December 31st, 1886	383
Number added during the year 1887	3
Number removed during the year 1887	5
Number in use December 31st, 1887	381

Digitized by Google

CHICAGO, December 31, 1887.

Revenue collected during the year 1887 measured by meters and used by hydraulic elevators and motors amounts to $499,233.95; a little more than one-third of all the money collected for water rates, it being $23,452.91 more than the collection for the previous year from the same source.

The seeming discrepancy between the elevators reported in use December 31st, 1886, and December 31st, 1887, is explained by the fact that elevators put in use have always been reported and those removed or abandoned and those run by steam and gas engines have not been entered in the report. There are now quite a number of elevators where the street valve is sealed and has been for more than one year that are liable to call upon the Department to break the seal and use water for a short time. Such are reported as not using water.

Submitted respectfully,

H. A. HAWKINS,

Superintendent Meters.

During the month of August an apparatus for using crude petroleum as fuel was introduced and used exclusively the remainder of the year.

The following statement of tests, made by Mr. T. T. JOHNSTON, Assistant Engineer, of the evaporative qualities of oil burned with this apparatus compared with coal, may be found of interest:

CHICAGO, January 12th, 1888.

MR. SAMUEL G. ARTINGSTALL,

City Engineer.

DEAR SIR: The following is a statement of the consumption and performance of oil as a fuel at the Fullerton avenue pumping station.

The use of the oil began in August, 1887, and the statement pertains to the period prior to January 1st, 1888.

I have the records of four direct trials of the evaporative power of the oil.

Three of these were made by Mr. Turnbull, with the following results:

Date 1887.	Duration, hours.	Revolutions.	Temp. of Feed.	Lbs. of Oil at 7 lbs. per gal.	Lbs. of Feed Water.	Evap. Lbs. Water pr. lb. of Oil
September (?).....	2.57	11856	134°	1176	14600	12.41
September 22nd	7.55	34090	139°	3528	43700	12.386
November 16th.....	6.30	28664	137°	2940	36200	12.31

Digitized by Google

The fourth trial was made by myself, January 7th, 1888.

The results are set forth in the following:

Duration in hours.	Revolutions per hour.	Head against pump.	Bbls. of oil.	Lbs. of oil at 7.1 lbs. pr. gal.	Lbs. of feed water.	Temp. of feed water.	Evap. lbs. water pr. lb. oil.
9.30 to 10.30	4658	2.90	1.70	.....	.....	.....	.....
10.30 to 1.00	4629	2.90	1.68	.....	.....	.....	.....
1.00 to 2.00	4619	2.85	1.70	.....	.....	.....	.....
2.00 to 3.00	4681	2.90	1.70	.....	.....	.....	.....
3.00 to 5.00	4630	2.75	1.725	.....	.....	.....	.....
5.00 to 6.00	4630	2.85	1.70	.....	.....	.....	.....
6.00 to 7.30	4576	2.85	1.67	.....	.....	.....	.....
Averages per hour for 10 hours....	4630	2.86	1.695	505.449	6005	127.47°	11.88

The steam pressure for all of these trials was 50 lbs. above atmosphere.

The oil used or burned January 7th, has been taken to weigh 7.1 lbs. per gallon, resulting from the weighing of a sample.

Mr. Turnbull weighed a sample last fall and found a gallon to weigh 7.00 lbs., which weight has been used in reducing his trials.

Ordinarily, the temperature of feed water is 120° or a little less—the aim being to maintain this figure. The following is the reduction of the foregoing results to the common basis of 50 lb. boiler pressure and 120° feed water temperature. That is, a reduction to ordinary working conditions.

Digitized by Google

No. of trial.	Actual temperature of feed water.	Ordinary temperature of feed water.	Evaporation obtained.	Equiv. evap. from and at 212°	Equiv. evap. from and at 120°
1	134.00	120	12.41	13.75	12.25
2	139.00	120	12.39	13.67	12.17
3	137.00	120	12.31	13.60	12.12
4	127.47	120	11.88	13.246	11.80

If the weight of oil per gallon be made the same for all trials, the following results for ordinary conditions:

No. of trial.	7.00 lbs. per gallon. Evap. from and at 120°	7.10 lbs. per gallon. Evap. from and at 120°
1	12.25	12.07
2	12.17	11.99
3	12.12	11.95
4	11.95	11.80

The following is a statement of oil burned in 1887, together with an approximation to evaporative power based on the hypothesis that at all times the amount of feed water per revolution was constant:

Month.	Bbls. of oil. 42 gallons per bbl.	Approximate Evaporation.
August.....	45.345	(?)
September.....	1107.1125	(?)
October.....	1194.0525	12.28
November.....	1182.355	11.85
December.....	1135.365	12.27
	$\frac{4664.230 \times 42 \times 7}{2000} = 685\frac{1733}{1000}$ tons.	

Digitized by Google

The following was the evaporative power of coal in the months named, feed water used being determined in same hypothesis:

Month.	Evaporation.
May	8.04
June	8.24
July	8.04

Very respectfully,

THOS. T. JOHNSTON,
Assistant Engineer.

CANAL PUMPING WORKS.

With the exception of twenty-one days in February and thirteen days in March, when the engines were stopped on account of high water, the engines have been in continual operation; three engines after March 20, except seventy-six days, when four engines were in action.

The following table gives the detail of operations for 1887 :

Digitized by Google

OPERATIONS OF ENGINES AT CANAL PUMPING WORKS.

MONTH.	Number of hours run per month.				Average number of revolutions per minute.	Average height of water in the river.	Average height of water in canal.	Average head of water pumped against.	Average number of cubic feet of water pumped per minute.	Pounds of coal consumed per month.	REMARKS.
	Engine No. 1.	Engine No. 2.	Engine No. 3.	Engine No. 4.							
January	.....	744	744	744	77¾	1.60	5.80	4.20	.....	1,503,125	
February	188	188	.....	.....	77½	2.20	4.30	2.10	.....	254,000	Stopped twenty-one days in February on account of high water.
March	374	374	345	.....	78	2.20	4.80	2.60	.....	777,250	Stopped thirteen days in March—water running over the dam at Desplaines river and an ice-gorge in the canal.

BUILDINGS FOR FIRE DEPARTMENT.

The following houses have been built for the Fire Department since the last report :

Station house for Company No. 37, at foot of La Salle street..... .$ 1,795 00
Hook and ladder house, corner of Oakley avenue and Thirteenth street..... 11,798.00

The hearty co-operation of the Commissioner and officers of the Department, and the faithfulness and efficiency of the entire staff of this Bureau, has made the working smooth and the relations pleasant.

Very respectfully,

WM. R. NORTHWAY,
Acting City Engineer.

DUTY TEST OF GASKILL ENGINES.

DEPARTMENT OF PUBLIC WORKS,
COMMISSIONER'S OFFICE, Oct. 16, 1887.

Messrs. THURSTON, COON AND WARRINGTON,

Experts to test the "Gaskill Pumping Engines," North Side Pumping Station.

GENTLEMEN :—In conducting the test of the machinery, we desire that you determine both the capacity and duty of the machinery.

Digitized by Google

In the performance of said duty and capacity, the steam pressure shall not exceed eighty (80) lbs. per square inch in the boilers, and the piston speed of the engines shall not exceed one hundred and twenty (120) feet per minute.

The coal used shall be ordinary Anthracite Coal, and the duty shall be performed without any deduction from the coal consumed, of clinkers, or any friction of machinery, friction of water in pumps, or connections for the use of steam, for fuel pumps, or any purpose due to operation of the machinery as a whole.

Also, to determine the capacity of said engines, boilers, pumps and appendages, in U. S. gallons, per day of twenty-four hours, under a maximum head of one hundred and fifty (150) feet above the surface of water in suction-well, with a piston speed of one hundred and twenty (120) feet per minute.

One or both the engines may be tested at one time, at the option of the experts.

Your committee will also determine and report if the design, material and workmanship, either as a whole or in part, are excellent, ample and sufficient for the purpose intended and comply with the specifications for the same, a copy of which is appended hereto.

Respectfully,

GEO. B. SWIFT,
Commissioner of Public Works.

Digitized by Google

CHICAGO, October 29, 1887.

HON. GEO. B. SWIFT,

Commissioner of Public Works.

SIR:—The undersigned, the committee appointed by you to make a trial of the new Gaskill pumping engines, now in operation at the North Side pumping station, beg leave to submit the following report of the results so obtained:

A trial of each set of machinery was made, beginning on Monday, the 24th inst., with the west pair of engines, the trials being of twenty-four hours' duration each, that period having been adjudged by the committee sufficient to settle the questions referred to it by the city. A supplementary trial was also made of the engines first tested to determine the efficiency of the boilers and the distribution of heat in the engines. The data obtained and the calculated results will be submitted in full detail later.

The conclusions of your committee are as follows:

The contract made with the Holly Manufacturing Co., of Lockport, N. Y., the builders of the engines, binds them to furnish two sets of pumping machinery, each capable of delivering 12,000,000 gallons of water per day of twenty-four (24) hours, against a head of one hundred and fifty (150) feet, the piston speed not exceeding one hundred and twenty (120) feet per

Digitized by Google

minute, and to develop a duty of not less than 95,000,000 foot pounds per one hundred (100) pounds of coal burned in the boilers, no allowance for ashes or any other wastes being made.

The contractors are also called upon to furnish engines of good design, construction and material.

Your committee find, upon test, that the engines furnished by these contractors are of good design, of excellent wormanship and, so far as they have been able to judge by inspection, of the best of material. This committee is also able to certify that the stipulated capacity has been secured, and that the duty actually obtained is considerable above that demanded, exceeding one hundred million (100,000,000) foot pounds of work done per one hundred (100) pounds of coal consumed.

Very respectfully,

R. H. THURSTON,
J. S. COON,
JAS. N. WARRINGTON,
Committee.

Digitized by Google

CHICAGO, February 21, 1888.

HON. GEO. B. SWIFT,

Commissioner of Public Works.

DEAR SIR:—I beg to present the enclosed report of results in detail of the trial of the Gaskill pumping engines, at the North Pumping Station, with compliments of the committee.

Very respectfully,

JAS. N. WARRINGTON.

REPORT OF TRIALS FOR DUTY AND CAPACITY OF GASKILL PUMPING ENGINES AT NORTH SIDE WATER WORKS, CHICAGO, ILL., OCT. 24–28, 1887.

HON. GEO. B. SWIFT,

Commissioner of Public Works, Chicago, Ill.

SIR:—Your committee herewith respectfully submit their final report on duty and capacity trials of the two sets of Gaskill pumping engines supplied to your city in 1887, by the Holly Manufacturing Company, of Lockport, New York.

DESCRIPTION OF PUMPING ENGINES.

The machinery tested is that contained in the recent addition to the North Side Water Works, and comprises two independent sets of pumping engines, each

Digitized by Google

set being really two independent and complete engines coupled to a common shaft, with cranks at right angles.

The engines are of the compound, condensing, horizontal beam and fly-wheel type. Each half of each engine has two steam cylinders situated in a vertical plane, and parallel to each other, the high-pressure being above the low-pressure, and very close together, making the steam passages between them as short as possible and keeping the clearance spaces down to a minimum.

The pistons being connected by short links to the short vertical beam, at opposite ends, travel in opposite directions.

The steam cylinders, sides and heads, are steam jacketed.

The double-acting pump plungers are in line with either low-pressure steam cylinder, and connected direct.

The high-pressure cylinder transmits its power to the pump plunger through the beam, which latter is between the steam cylinders and pumps.

The upper end of the beam is also connected with the fly-wheel shaft, the pedestal of which rests on top of the pump delivery chamber.

The low-pressure steam inlet valves, which are also the high-pressure exhaust valves, and the low-pressure exhaust valves are multi-ported, or "grid-iron" slides, worked by eccentrics from a lay-shaft

Digitized by Google

lying alongside the high-pressure cylinder. The high-pressure inlet valves are double-beat poppets, operated by a "drop" cut-off, adjustable by hand.

The valve gear gives a very good steam distribution, favorable to economy in the consumption of coal.

The pump valves are numerous and very small, having a lift of only five-sixteenths inch, and a clear water way of about one and one-fourth square inch. The valves, faced with rubber, are noiseless and very efficient, as is shown by the small loss of action, or slip, being about 2¾ per cent. on the west engine and about 3.2 per cent. on the east engine.

All bearing surfaces are ample for long continued and uninterupted service, while the design and construction are to be commended for great strength throughout. The workmanship is also excellent.

PRINCIPAL DIMENSIONS OF THE ENGINES.

Diameter of high-pressure pistons	27 inches
Diameter of low-pressure pistons	54 "
Stroke of pistons and plungers, nominal	40 "
Diameter of high-pressure piston rods	3.5 "
Diameter of low-pressure piston rods	4.5 "

CLEARANCE, IN TERMS OF CYLINDER VOLUMES.

High-pressure, back end	3.72 per cent.
High-pressure, piston rod end	3.77 "
Low-pressure, back end	2.102 "
Low-pressure, piston rod end	2.055 "

Digitized by Google

Diameter of plungers.....30 inches
Diameter of plungers, rods..... 5 "

STROKE OF PUMP PLUNGERS OBSERVED.

East engine, east plunger.....39,687 inches
East engine, west plunger.....39,781 "
West engine, east plunger.....39,812 "
West engine, west plunger.....39,812 "

BOILERS.

Steam is supplied to the engines from boilers of the horizontal, return tubular type, in brick setting. They were also furnished by the Holly Manufacturing Co. The steam pipe, passing from the boilers, passes through the uptake for a considerable distance, thus exposing the steam to the superheating action of the escaping gases. The superheating actually realized is slight, but it ensures dry steam.

DIMENSIONS OF BOILERS.

Diameter of shell.....66 inches.
Length of shell.....18 feet.
Number of tubes.....66.
Diameter of tubes..... 4 inches.
Diameter of steam drum.....33 "
Width of grate..... 5 feet.
Length of grate..... 5.25 feet.

Digitized by Google

Grate area	26.25 sq. feet.
Area of chimney	44.4 "
Height of chimney	125. feet.
Length of flues connecting to chimney,	16. "
Area " " "	22. sq. feet.
Heating surface, water	1438.7 "
Superheating surface, steam pipe	182. "
Draught area, through tubes	5.76 "
Ratio grate to water heating surface	1 to 54.8

Feed water for the boilers is supplied by feed pumps driven by the pumping engines. The feed water is taken from the hot well, from which it passes through a small heater whose source of heat is the condensations from the jackets. The jacket condensations are also pumped into the boiler. By this means an average temperature of 180° was imparted to the feed water.

CONTRACT REQUIREMENTS.

The contract with the Holly Co. binds them to furnish two sets of pumping engines, capable of a combined delivery of twenty-four million gallons of water per day of twenty-four hours, against a head of one hundred and fifty (150) feet, at a piston speed not exceeding one hundred and twenty (120) feet per minute, at a boiler pressure not exceeding eighty (80) pounds per square inch, and to develop a duty of not less than ninety-five million foot pounds (95,000,000)

Digitized by Google

per one hundred (100) pounds of coal burned at the boilers, no allowance for ashes, friction or any wastes to be allowed. It was further stipulated that the above quantity of water should be delivered when two-thirds the boilers furnished were supplying steam to the engines, and that the duty should be based on the water delivered, as determined by weir measurement.

MANNER OF CONDUCTING THE TRIALS.

Local conditions rendered it inexpedient to run both engines at once, during the trials. It was decided to test each engine separately, for a period of twenty-four hours.

Since a boiler test could not be made in conjunction with a duty and capacity test without lowering the temperature of the feed water (in transit through weighing tanks), each engine was tested in exactly the conditions which maintain in every-day service.

Very satisfactory facilities for gauging the water delivered by the pumping engines had been provided. A weir flume of ample length, having a cross section eleven feet wide by seven feet deep, was provided at its entering end with gratings to insure an even flow of water in the flume, and a weir notch with carefully prepared metallic knife edges at its exit end. A vernier hook gauge, located in a box at one side of the flume, indicated the height of water on the weir

Digitized by Google

notch. All precautions, as recommended by Mr. James B. Francis, were observed in connection with the weir measurements, and Mr. Francis' formulas were used in the computations.

In ordinary service the water pumped by the engines is delivered directly into the city mains. During the tests, communication with the city mains was shut off, and the water delivered to the measuring flume, from which it passed over the weir notch, to a launder emptying into Lake Michigan.

Since the measuring flume was below the engines, in order to create an artificial head for the engines to pump against, a gate valve in the delivery main, near the engine-house, was partially closed, until a throttling resistance corresponding to a total head of about 150 feet was obtained.

In the beginning of the first trial nearly an hour elapsed before the resistance and engine speed could be adjusted conformably to the conditions of the contract. Hence, the capacity of the (west) engine should be based on the time during which it was running under normal pressure and speed. The duty, of course, is figured for the whole time. The (west) engine was run, however, more than twenty-four hours, under normal conditions.

Of the six boilers in the battery, two, Nos. 1 and 2, were used throughout the tests, and these had been under steam for several days prior to the trials.

Digitized by Google

In consequence of the peculiar conditions under which the engines were compelled to work, it was decided best to make a running start.

The first trial was with the west engine Oct. 24, 1887, and was conducted as follows: With the engine running, the fires under boilers Nos. 1 and 2 were quickly hauled, and the grates cleaned, the steam for keeping the engine running coming mainly from boiler No. 3, which was under steam. Kindling wood was quickly placed under boilers 1 and 2, the wood being charged to the experiment as equivalent to four-tenths (0.4) its weight in coal. At the instant the fire was lighted boiler No. 3 was shut off, time was taken, 2:29 P. M., and the test began. The engine counter was taken, steam pressure and height of water in the boilers carefully noted. At the close of the trial, after the last firing, when the steam pressure had fallen to the point at which it stood when the fires were lighted, the water level in the boilers being also the same as at beginning of trial. The trial was closed at 3:59 P.M., October 25. The fires were immediately hauled, with the intention of picking out any unburned coal, but not enough remained unburned to make any account of. The steam pressure in boiler No. 3 was kept below that of the boilers supplying steam to the engine.

The trial with the east engine began Oct. 26th, and was conducted as follows: With the engine running,

Digitized by Google

the fires under boilers No. 1 and 2, supplying steam to the engine, were allowed to burn low, and when it was decided to commence cleaning the fires, time was taken, 11:35 A. M., and the test began. The engine counter was taken, steam pressure and water level in the boilers recorded. The fires were then cleaned, all coal added being charged to the experiment till the close of the trial, when, after the last firing, the fires were brought as nearly as could be judged to the same condition as at the beginning, the steam pressure and water level in the boilers being also the same. When it was decided that the fires needed cleaning, time was taken, 11:40 A. M., October 27th, the engine counter taken, and the trial declared closed.

It was predicted that the east engine would show the higher duty, and the tests verified this.

The coal was weighed in iron barrows, on a small platform scales, 300 lbs., net, at each barrow-full. During the trials the scales were sealed by the local Sealer of Weights and Measures.

The coal used was clean "egg" anthracite, such as is supplied to the city water works.

Two observers were in constant attendance in the boiler-room to look after the coal.

Two observers were also in attendance at the weir, where observations on the hook gauge were made every ten minutes.

Digitized by Google

A metallic float gauge, inclosed in a gauge box in the pump well, indicated the water level in the latter. The zero of this gauge was carefully referred to the center of the pressure gauge in the force main.

The steam temperature was indicated by a thermometer screwed into the steam pipe near the engine.

The force main pressure gauge, and the thermometers, were prepared specially for these tests.

Observations were made, as to the quality of the steam, with a barrel calorimeter. These observations indicated dry steam. The thermometer in the steam pipe showed about 4. degrees super-heat.

Observations were made every fifteen minutes on the engine counter, pressure gauges and thermometers in the engine and boiler rooms.

A few sets of indicator diagrams were taken, to obtain an idea of the steam distribution, but more particularly to ascertain the friction of the engine and percentage of useful effect. The friction was thus ascertained to be 7.64 per cent., and the efficiency 92.36 per cent.

It is to be borne in mind that the duty, as required by the contract, and as given in the tables, is figured on the weir measurement. If figured on plunger displacement, as is customary, the mean duty for both engines would have been about 103,072,000. foot pounds.

Digitized by Google

The necessary data for determining the steam used per indicated horse power, was obtained during the boiler trial, to be described hereafter.

The tabulated results for the second trial of the west engine, which was run during the boiler trial, are merely incidental. The drop in the duty during the second trial is due solely to the lowering of the temperature of the feed water from 181. degrees to 148. degrees. Making the proper correction for this loss of temperature (caused by the feed water standing in the measuring tanks) the west engine, for the boiler trial, should be credited with a duty of 100,277,000. foot pounds:

In the following table, column (1) gives the indicated horse-power by five sets of indicator cards taken from the steam cylinders of the west engine. Column (2) gives the simultaneous horse-power in water pumped, as per weir discharge. Column (3) gives the horse-power by the plunger travel against the total head. Columns (4) and (5) give the per cent. of indicated horse-power utilized, being the ratios of columns (2) and (3) to column (1).

The difference between the averages of columns (1) and (3), viz: 28.5 horse-power, is the friction of the engine, which, at that speed, would remain practically constant for varying heads, so that for any other head the duty of the engine can readily be calculated. Thus, for a head of 300. foot the duty would be increased 3.6 per cent. But this is only approximately correct, as, under increased head increased steam pressure and cylinders would be necessary.

BOILER TRIAL.

The test of boilers No. 1 and 2 was conducted in precisely the same manner as with the trial of the east engine, and in addition, the feed water was weighed. With the (west) engine running, the fires under boilers No. 1 and 2 were allowed to burn low, and when it was decided to commence cleaning fires time was taken, 10:23:30 A. M., October 28th, and the test began, the steam pressure and water level in the boilers being carefully noted. The fires were then cleaned, all coal added being charged to the experiment, until after the last firing. The fires were brought as nearly as possible to the same condition as at the beginning, the steam pressure and water level being also the same. When it was decided the fires needed cleaning time was taken, 10:40:30 P. M., October 28th, and the trial closed.

Incidentally, all observations in the engine room and at the weir were made during this test as during the others.

Excellent facilities were provided for weighing the feed water. The feed water was pumped (by the feed pump, driven by the main engine) into an elevated tank, No. 1. As needed, the feed was drawn from tank No. 1 into a weighing tank, resting on platform scales, each charge weighing about 2,000 pounds net. From the weighing tank the water passed into tank

Digitized by Google

No. 3, and from the latter pumped into the boilers by an independent steam pump supplied with steam from boiler No. 6. The pressure in boiler No. 6 was kept below that in boilers No. 1 and 2.

In order that the resistance against the pumping engine should be the same as if it were pumping the feed water directly into the boilers, as during the other trials, a throttling valve was placed in the feed pipe between the pumping engine and tank No. 1, and adjusted so that the resistance against the pump equaled the boiler pressure. (See column 19 of the engine room log for October 28th.)

Columns 25 and 26 of boiler room log for October 28th, give the overflow from tank No. 1, as measured by a Worthington Meter. This overflow is the water pumped, by the feed pump at the engine, in excess of the boiler requirements.

Your committee take pleasure in stating that the performance of the engines and boilers is, in their opinion, eminently satisfactory, both the duty and capacity being in excess of the guarantee; the mean

Digitized by Google

duty for both engines being over 6 per cent. in excess of the requirements of the contract.

In conclusion, we beg leave to express our thanks to the contractors, to officials at the City Hall, and particularly to Mr. T. T. Johnston, of the City Engineer's Office, for courtesies and valuable assistance.

Very respectfully,

ROB'T H. THURSTON,
J. S. COON,
JAS. N. WARRINGTON.

CITY OF CHICAGO,
DEPARTMENT OF PUBLIC WORKS,
February 25, 1888.

HON. GEO. B. SWIFT,
Commissioner of Public Works.

DEAR SIR:—Less than thirty days have expired since I was placed in charge of the Water Works System of Chicago, and I have not yet had sufficient time in which to investigate, so as to make an exhaustive report.

I have visited the different pumping stations and observed the working of the machinery. The four compound beam engines at the West Side pumping works are comparatively new. The boilers are said to be in good order, and the work performed seems to be satisfactory. As soon as possible I will make tests and submit a report in detail.

The Fullerton avenue and Canal engines are doing their usual work, and I did not think it important that tests should be made at once.

At the North Side Chicago avenue pumping station I found a very bad state of affairs, and have devoted most of my time to making investigations at these works. All the engines, except the new Gaskill engines, are old, having been built in the years 1853, 1857, 1867 and 1872.

The two single-beam engines of 1853 and 1857 are now run every day, but they are stopped for a few

Digitized by Google

hours each night, when the demand for water is not as great as during the day time. These engines, the 1853 and 1857, have done much service, and need a thorough overhauling if they are to be continued in use, but more modern engines would work with greater economy. I would say, however, these engines were up to the standard when they were built.

The small double-beam engines of 1867, usually called the North Engines, had been repaired, and the work was about finished when I arrived here, and I had no time to examine them before they were started again. These engines work now daily. They have steam cylinders 44 inches diameter, with 8 feet stroke, and double-acting water pumps, originally 28 inches diameter, 8 feet stroke, but having been re-bored lately they now measure: on the north engine $28\frac{57}{64}$ inches diameter, and on the south engine $28\frac{55}{64}$ inches diameter.

Indicator cards taken of these engines, since their repair, show that the steam cylinders perform the following work:

Engines running at 9.5 revolutions per minute, or 153 feet per minute:

	HORSE POWER
North Engine, bottom of cylinder.....	57.63
" " top " "	27.14
Difference	30.49
" " both sides together	84.77

Digitized by Google

	HORSE POWER
South Engine, bottom of cylinder	66.27
" " top " "	39.37
Difference	26.90
" " both sides together	104.64
Grand total	190.41

At another time the engines were making 14 revolutions, or 224 feet per minute, piston speed :

	HORSE POWER
North Engine, bottom of cylinder	108.87
" " top " "	74.80
Difference	34.07
" " both sides together	183.67
South Engine, bottom of cylinder	131.54
" " top " "	86.73
Difference	44.81
" " both sides together	218.27
Grand total	401.94

The difference between the power applied to top and bottom of steam cylinders is due greatly to the unequal balancing of the two ends of the beam, the air pumps being located on the cylinder end of the beam. The cut-off on the valve gear has to be adjusted to make the engines run even, but the main reason is that the large valves in the valve chambers

Digitized by Google

of the pumps are of a faulty construction. The suction valves do not close quick enough; they float, and much water is lost in this way, because a great part of the water in the pump barrel floats back into the well through the suction valves, until the current of the water through the valves helps to close them, and then only the balance of the water is discharged into the water mains.

Supposing the pumps are working right without losing any water, the pumps of the North Engine, having 656 square inches area, at 9.5 revolutions per minute, or 153 feet of speed, against a head of 112 feet, or 56 pounds, with 20 per cent. only added for friction, would need 204 horse power. But the power used is only 84.77, as the indicator cards show,—a loss of 119.53 horse power, or 58.53 per cent., because the work cannot be performed without the necessary power to do it; or the engine should have done 140 per cent. more than it did at that speed.

The South Engine, having only an area of 633 square inches in the pump, should use 198 horse power, but the cards show only 105.64 horse power,—a loss of 92.36 horse power; or both engines together are supposed to perform, at 9.5 revolutions per minute, 402.3 horse power, while the cards show 190.41 horse power,—a loss of 211.89 horse power, or 52.74 per cent.; or engines should have done 110 per cent. more than they did at that speed.

Digitized by Google

The same engines sometimes have a higher speed, 14 revolutions per minute; and, at that speed, the

	HORSE POWER
North Engine should show	299.1
South " " "	288.0
Both	587.1
While the cards only indicate	401.94
A loss of	185.16

or 31.71 per cent.; or the engines should have done 46 per cent. more work at 14 revolutions per minute.

The engines go through the motion as if they were performing a large amount of work, *but they do not do it.* The above figures show about what they are doing. This can be remedied at small expense, and I recommend that these engines be changed as soon as large 1872 engines are running.

The largest engine, the double-beam engine of 1872, at the south end of the building, was working when I came, but only for a few days, or until the small double-beam engine of 1867 was ready to start. A small defect in the vacuum, caused by leaky valves on the air pumps, hastened the decision to shut down, and the next morning the work of taking the engine apart for repairs was commenced.

Nothing but the usual amount of wear and tear on the valve motion and on the connections of the engine was found. The rubber valves for the air pumps

Digitized by Google

needed to be replaced by new ones. The pump valves for the service pumps were in good order, and perfectly tight. By examining the pumps I found the pump barrels of both of them cracked from top to bottom, and in several places. A new inside cylinder or sleeve inserted in each pump in sections. The original diameter of the pumps was 57 inches; now they are 54 inches. The space between the new cylinder and the old cracked pump cylinder is filled with sulphur, and the inside cylinders are held in position by set screws. A small iron band is clamped around the broken cylinders. The sleeve is held in place by a ring over the top and bottom, with rods running the whole length of the pump. I cannot, without going into a thorough examination of facts connected therewith, find out positively when the pumps burst, or when they were repaired.

When these large beam engines (1872) were new, double beat valves of brass were furnished; fifteen valves for the suction of each pump, twelve valves of the same size for discharge valves, there being no valve in the bucket. The valves were constructed in the usual way; lower diameters of valves, $15\frac{5}{16}$ and $16\frac{1}{2}$ inches (outside and inside diameter of seat); upper diameters of valves, $12\frac{9}{16}$ and 14 inches; each valve having 30.15 square inches of ring surface for lifting, and 89.875 square inches for floating or resisting to close; each weighing 75 pounds in air, or 66 pounds

Digitized by Google

when submerged in water ; requiring nearly 2 pounds of vacuum per square inch for lifting, if there had been no head of water in the well to help lift. These valves, a number of which are yet stored at the station, could lift originally 2½ inches high, while 1¾ inches would pass all water which the clear opening of the base would admit, and less lift would admit plenty of water to fill the pump. These valves probably worked noisily, but well enough to fill the demand, or to do their duty. They were, however, for some reason condemned, and (1876 or 1877) new valves were put in these pumps, which made matters worse. These new valves, which are yet in the pumps, are also double beat valves, of cast iron, with wooden seats. The clear opening of the fifteen suction valves is 657.9 square inches less than in the old brass valves, or 28.4 per cent. smaller ; 110.07 square inches against 153.93 square inches in each valve. Each valve has lower diameters 17 5/16 and 15 1/16 inches, and upper diameters 10 9/16 and 8 11/16 inches ; or a ring area of 90.57 square inches for lifting and 175.67 square inches for floating, against 89.875 on the old brass valves. Each valve weighs 122 pounds in atmospheric, or 105.12 pounds under water, and requires only 1.16 pounds of vacuum for lifting, against 2 pounds on old valves. The weight to close the valves was in this proportion: For old brass valves 0.73 pounds per square inch; for new iron valves only 0.59 pounds per square inch,

Digitized by Google

and comparing the clear openings upon top of the valve bell, the old valves have 184.15 square inches on bottom of ring and 90.36 square inches clear opening on top, or as 100 to 49. The new valves have 178.19 square inches on bottom of ring, and only 39.93 square inches clear opening on top for the water to pass through in settling down, or as 100 to 22.4.

This large ring area, with only 0.59 pounds per square inch weight for closing, acts like a parachute, and keeps the valve suspended or floundering in the water instead of letting the valve seat quickly when the bucket of the pump arrives at the top of its stroke, and this caused the valves to seat heavily after the pump bucket has started on its down stroke, the current of water passing through the valves backward, carrying the valve down with force. It would seem from examination of official reports which I have collected and attached hereto, that serious trouble commenced after these new valves were put in, and some remedy was sought after.

The air was brought into requisition. At first a small pump was employed, according to official reports—I quote only those referring to the 1872 engines.

I found at the North Side works several air pumps, and as I never had seen a regular air compresser used to supply air in such quantities in the valve chamber of a service pump, I commenced at once to

Digitized by Google

investigate. There are three air compressors now in the basement of the North Side pumping station. One duplex double acting machine, with two air cylinders 9½ inches diameter, 8 inches stroke, which was running at a speed of 80 revolutions per minute, furnishing 181.450 cubic inches, or 105 cubic feet of air at atmospheric pressure; another air pump with two cylinders, which at 40 double strokes can furnish about 30 cubic feet of air per minute; and a third steam pump which was used, and is yet used, to pump dry the well in which the pumps are placed. This pump had a new pump cylinder put on, so as to pump air for the valves on the big engine when it was not used for pumping water. This pump can furnish over 40 cubic feet of air very easily per minute. Either one of these latter pumps was always worked together with the duplex double acting air compressor, so that the amount of air furnished ranged from 135 to 148 cubic feet per minute.

I searched in the annual reports of the Public Works, and as near as I can gather from these official yearly reports of the engineer, the supply of air was gradually increased from time to time. I desired to know the reason why it was necessary to pump so much air into the pumps of these engines.

I know on all pumping engines a small quantity of air is required to keep the air chamber on the discharge pipe supplied with air, as the air under pres-

Digitized by Google

sure somehow works out of the air vessel and causes the engine to thump. This air can be easily introduced through a small pipe with check and regulating valve on the suction side of the pump, but it is also a fact, that in cases where air enters the valve chamber with the supply of water, which is often the case where closed suction pipes are used, a quiet working of the pump and valves is impossible. Sometimes a small force pump is supplied to force air into the air chamber direct on the discharge pipe, if the amount of air gets too small to furnish the necessary air cushion. If the pumps take solid water, and the valves are made in such a way as to automatically adjust their lift, necessary to let the water follow the bucket and close gradually by the time the bucket is at the end of the stroke, the valves will make no noise, and the pump will do its full duty. On double beat valves the difference between the lower and upper valve faces should be as small as possible, enough only to let the vacuum, formed by the bucket moving away from the valves, lift the weight of the suction valves easily, so the water will or can enter through the valves. The weight of the valves must be great enough to act continually, to seat the valves as soon as the speed of the bucket diminishes, in as short a time as possible to prevent any thumping of the valves, and to prevent any loss of water running back through the valves. About 1878, the new double air compressor was put to work,

Digitized by Google

and all the air wanted was supplied. What was the effect of introducing air into the pumps at the suction end? The apparent effect was: the pumps worked easier, the valves worked perfectly quiet, and everybody probably was happy, But the West Side pumping station had commenced pumping by that time, or a defect in quantity of water would have been easily detected. Let us see how it worked. The valves have each a lifting area of 90.57 square inches, and weigh 105.12 pounds under water. It requires only 1.16 pounds per square inch to balance or to lift them. The water in the well outside the pump chamber stands about 8 to 10 feet above the suction valves; therefore, it exerts 4 to 5 pounds of pressure per square inch to lift the suction valves, while there is only 0.59 pounds of weight per square inch to hold them down. The valves would open without the vacuum caused by the bucket rising and let the pump fill nearly to the level of the water in the well, but that is also the cause of increasing the laziness of the valves in closing to prevent the water from escaping into the well again.

The air from the air compressors was now introduced right under the pump bucket in the valve chamber, under a pressure of 10 to 12 pounds above atmosphere; but as soon as the bucket ascends, this air, 11664.5 cubic inches of atmospheric air for every up stroke of the bucket, expands, and of course keeps

Digitized by Google

as much water out of the pump barrel as this air occupies space under the existing pressure. The suction valves open now to admit water, but the pump barrel cannot fill on account of the air. The valves flounder or hang suspended in the water, having only 0.59 pounds per square inch to close them. The bucket descends and compresses the air slowly, or pushes the air which is filling the pump barrel, down again. A part of the water, occupying the lower part of the valve chamber, escapes again through the yet open valves, and the valves close only slowly during the increasing velocity of the bucket on its down stroke. No jarring on account of the air cushion above it, and its slowly increasing compression. The air is now further compressed and escapes or is forced into the mains through the delivery valves with some of the water until the bucket comes to its lowest position. A new stroke commences, more air is coming in at 10 to 12 pounds of pressure above atmosphere, and the same operation is repeated as before. The actual loss of water can only be guessed at, but the loss of the capacity of the pumps is immense.

This has been going on for ten years, from 1878 to 1888. If the engine had been pumping water with its 54 inch diameter bucket against a head of 112.5 feet, going at the rate of 10 revolutions, with 10 feet stroke, the indicated horse power of the engine for that work should have been about 932 at least. The

Digitized by Google

cards taken from the engine show only 614 horse power, or 318 less than the work supposed to have been performed; in other words, the work supposed to have been performed by the pumps was greater than the power actually employed. Should not this have been a reason for investigating to ascertain how this was possible?

Indicator cards taken from the big engine, just before stopping, show:

	HORSE POWER
North engine, top of cylinder	89.3
" " bottom of cylinder	178.73
Difference	89.43
" " both together	268.03
South engine, top of cylinder	130.0
" " bottom of cylinder	216.0
Difference	86.0
" " both together	346.0
Grand Total	614.03

Some years since the buckets of the pumps were reduced from 57 inches to 54 inches diameter after the pumps burst, but the plungers were left the same as they were originally before the accident—40½ inches diameter. This difference of 131 square inches of plunger area from what it should have been

Digitized by Google

requires about 26.6 horse power more to displace that amount of water on the down stroke of each pump. But instead of that the cards show 89.43 more horse power on the north engine, and 86.0 horse power more on the south engine on the bottom side of the piston, which indicated that there must have been something wrong in the working of the pumps, the difference of 112.6 and 116.43 horse power being too large to be accounted for by any unequal balancing of the working part of the engine, as the air pumps are on the opposite end of the beam from the steam and pump cylinders.

The down stroke of the north (1872) engine should show 262.0 horse power while the cards indicated only 89.3 horse power, a loss of 172.7 horse power, or 66 per cent; or the engine should have done 193 per cent. more work than it did. The up stroke of the same engine should show 255.7 horse power while the cards indicated 178.73 horse power, a loss of 76.97 horse power, or 30 per cent; or the engine should do 43 per cent. more work. This loss is accounted for partly by the compressed air forced under the bucket, which helps to lift the bucket, instead of steam power under the piston; but the power spent to lift the column of water on top of the bucket is spent uselessly, as the same water, or the greater part of it, follows the bucket down again on the down stroke. It is not forced into the mains. The loss of water

Digitized by Google

is as great on the up stroke, as the percentage of power lost on the down stroke of the bucket. Besides the power spent to compress the air and force air into the mains which was of no use whatever.

I understand complaints have come in frequently of lack of water in upper stories, no head of water, noise in the pipes, and it is even officially stated that a loss of 12 pounds of pressure exists between the pumping station and the immediate neighborhood of the tower after the water has passed the stand pipe.

The pamphlet "Preliminary Report of the Drainage and Water Supply Commission of the City of Chicago," of January, 1887, page 40, contains a diagram showing the water pressures in the Chicago water mains, December, 1886; and it shows a decidedly lower pressure in the pipe after the water has passed the tower. Investigating this, the Assistant Engineer stated to me that he had made an experiment in the tower by lowering into the open stand pipe a light, which was extinguished when it came within 15 or 20 feet of the water level. "You see," he said, "if there was any air coming with the water, the light would burn." Now, just the contrary is the case. A great part of the air pumped with the water through the pumps, when passing below the stand pipe, escapes through this stand pipe, forming at the top a perfect spray, which rises so high that no light can burn in that spray within 15 or 20 feet of the real water level.

Digitized by Google

I am informed by men at the Works that a few years since the tower was frozen, and this explains how it was done. The balance of the air in the water is forced into the mains, and escapes through the faucets, hydrants, and other connections, and causes that disagreeable splurting of the water when faucets are opened ; and the water is milky-white when drawn, on account of the quantity of air in it, getting clear when it stands a while, and the air escapes. The engineers at the Works say : When the tower was thawed out by fire-pots the escaping air and spray at the top, also the trembling of the tower was noticeable for hours, and after the air had escaped the former state was resumed. (The city pipes contained more air than water.)

A few minutes after I arrived in Chicago I opened the faucet over a wash-basin in my room at the hotel, and the water was sent all over by the force of the air behind it. After I had collected some in the basin the water looked perfectly white, but it soon got clear. Examining some water drawn from the faucet into a glass, I saw the air bubbles escape. The same thing happened in the morning, and during the day I made my first visit to the North Side Water Works. When I saw there the air compressors in full operation, the mystery was explained at once. This compressed air in the pipes exerts the same pressure on the gauge showing the head of water, as if it was

Digitized by Google

water; but as soon as the air, or a part of it, has escaped, that amount of pressure equal to the escape of air, is gone, and that *accounts for the loss of head when the water has passed the tower. The head at the North Side Station is false.* The water west of the tower cannot rise to the upper stories, since it is deprived of twenty-four feet of height by the loss of the escaped air, and subsequently reduced pressure.

I see in the reports for last year: "This double engine ('72') has been credited with running 8,674$\frac{19}{60}$ hours last year, and with making 4,686,987 revolutions, pumping, at 2,245 gallons per revolution, 10,522,285,815 gallons. From observations recently made and reported, it appears that this estimate is very much too large; and from later observations our mechanical engineer, Mr. J., is doubtful if the engine is adding much, if anything, to the city's water supply. It is most unsafe to hazard any estimate of the actual effectiveness last year."

This beam engine, "'72," in its present condition, developing 614 horse power, used about 24 tons of coal in 24 hours, which, at the price paid, $6.25 per ton, makes $150.00 per day; and for the whole of last year's run of 8,674 hours, or 361 days, $54,150.00, and for the time the engine has been in this condition, say nine years, in that proportion, $487,350.00, for which very little value has been received. These

Digitized by Google

figures do not include salaries of firemen and engineers, and other expenses connected therewith.

Having stopped the engine for general repairs, I propose to make changes so as to increase the supply of the city. This engine has been used for years, doing only 614 horse power. I am in doubt about working this engine to its full capacity with the outside pump cylinders of the pumps burst, and having bushings of only 1¼ inch thickness inside, with sulphur backing. When we start to pump water, using 932 horse power, the pump cylinders may not stand the strain, and must be operated with care. If it should be found necessary to remove the pumps, a long stoppage of the engine would be required, besides an expense of from $40,000 to $50,000.

I shall require the engineers in charge of the different stations to take indicator cards from their engines running, every day if possible, and send duplicates to the Chief Engineer's office for record. The indicator cards of an engine tell the true story of its condition.

The duplex pumps for the City Hall plant of elevators, and the engines for the electric lights at the same place, are reported "all right."

Some more working tools may be required for the machine repair shops at the North Side, to keep up with the demands on account of hydrants, meters and engines.

Digitized by Google

I have gone more fully into the explanation of the difficulties at the North Side Pumping Station than I intended, but I thought the importance of the matter required that everything be made as plain as possible.

I also find in the basement of the North Side Pumping Works two large Knowles direct acting steam pumps, said to be of three millions capacity each. These pumps are never used. I find in the reports that they were put in to be used in case of repairs, but as they took steam full stroke, and are not in any sense economical, the boilers could not supply sufficient steam to run these in connection with other engines that would be necessary to supply the required quantity of water. Whatever expense was incurred in connection with these pumps must be considered a total loss, unless the pumps can be removed from this station and utilized elsewhere; and if removed, it is a question whether they are of any particular value for use by the city. In any event, they could not be used by the city unless they were compounded at an expense of from $3,000 to $4,000; and if compounded, they would work nearly as economically as any of the low-pressure engines now in use at the North Side Works. The total cost of these pumps, with connections and foundations, must have been at least $8,000, and you can find this by referring to the books and official reports.

Digitized by Google

I have made no statement as to the Gaskill engines for the reason that the experts who tested them for the city have not yet made their official report. These pumps seem to be working well and doing good service for that kind of pump.

Yours respectfully,

F. W. GERECKE,

Engineer in Chief, Water Works.

great improvement. The engine was started soon after, and has continued in operation day and night since that day, working in the most satisfactory manner, and at present time is in prime condition. No accident or breakage of any kind has occurred during the past year."

1881. Page 33. "The operation of North Works has not been interrupted during the year from any cause—the pumping machinery is in good order."

1882. Page 57. "The south 1872 engines have pumped over two-fifths of all the water delivered from these works, and have been running 343 days, having stopped about 18 days for overhauling." * *

In 1883 "The south 1872 engines have pumped over five-eighths of all the water in 353 days in the year." In 1885 "The south, or 1872 engines, have been in continuous operation, except one or two stoppages of a few hours duration, from May 6th to November 25th." In 1886 "The engine has been in operation 361 days, etc." * * *

COMMENTS.

Referring to the report of 1877, page 45, in reference to engine "1872," the report says: "An apparatus has been devised for the purpose of introducing an air cushion into the water pumps," etc. It would appear that this apparatus consisted of an air pump for forcing air into the valve chamber between the

Digitized by Google

suction and discharge valves, and from investigations it also appears as if they considered it too small, and please note that former reports state that "*all worked well and satisfactory;*" also please note page 40, report 1878, where it says: "This south engine, 1872, has been in operation 287 consecutive days and nights, etc.," and judging from prior reports this engine has been in operation night and day a large portion of the time since 1872.

The statement is also made: "That the two double engines at the North Works and the two single engines at the West Works are in reality the main reliance of the city for water."

Notwithstanding these reports, on page 41, report of 1878, "A new air compressor was connected to the engines," and in report of 1879, page 33, "A thorough refitting of the pumps of 1872 engine," it is stated, "was completed in June last and proved a great improvement." And so on down to 1886.

I do not find anything mentioned anywhere of the accident that must have happened to the pumps of the 1872 engine sometime during the years quoted above. Nor do I find any explanation as to what caused the breakage, or any statement as to the probable cost of putting in new pumps, or the cost of repairs, or any estimate of the depreciation in value of the machinery in consequence of the breakage. In talking with the engineers I find that some are

Digitized by Google

inclined to the belief that these pumps were broken when they were tested and overtaxed by the tests made by the Citizens' Association; and it is also stated that the cracks were not discovered for a long time, and not until City Engineer CHESBROUGH insisted that the pumps be shut down for investigation, and it was then discovered that extended repairs were necessary. Of this I find no report. The only way that I can explain the accident to the pumps is that they took air suddenly, either through a leak or by low water in the well, and the bucket hit the water in mid stroke. It must have been done in both pumps at the same time, because both pumps are burst in identically the same way.

F. W. GERECKE,

Chief Engineer of Water Works.

VESSEL DISPATCHER'S REPORT.

GEORGE B. SWIFT, Esq.,

Commissioner of Public Works.

Sir:—I herewith present you my report as Vessel Dispatcher for the past season of Navigation, commencing with the Telephone System, August 12th, and ending December 11th, 1887.

There has been no record of the number of vessels passing through the various bridges, nor the time occupied for each swing, excepting at Clark and Madison streets, for two months previous to the adoption of the telephone system. From this record I am led to believe that this system has reduced the time of opening and closing nearly one-half, thereby affording a great convenience to the public.

The number of arrivals and departures (per Custom House Report) in the Chicago River, was 21,748, being larger than any year since 1882. There are not so many vessels engaged in the grain trade as in former years, but they are a great deal larger, and mostly steamers, and therefore make more trips dur- ng the season of navigation.

Digitized by Google

I would state that the Telephone System has been of great service to the public in many ways. It has reduced the time of swinging the bridges, saved the bridges from many collisions, thereby saving time to the public; it has nearly, if not fully, suppressed the whistle nuisance and has been of great service to the harbor masters in preventing and clearing up the jams and blockades in the river.

We have called the Patrol Wagon for the recovery of dead bodies in the river, seven (7) times; for the arrest of drunk and disorderlies, ten (10) times; for the removal of persons injured along the river, eight (8) times, and have reported still alarms of fire to the Fire Alarm Office, three (3) times.

The Telephone System is of great service to bridge-tenders in reporting their wants as to the necessity of repairs to bridges, and also saves the bridge carpenters many trips as to the material needed to repair the same.

A law compelling masters of large steamers to employ the use of a steam tug to assist in passing through the bridges would greatly lessen the time of keeping the bridges open and would materially aid public traffic and travel.

There are now in winter quarters, in the Chicago River, three hundred and thirty-one (331) vessels, of which seventy-nine (79) are steam, and two hundred and fifty-two (252) are sailing vessels. The grain

Digitized by Google

carrying capacity of these vessels exceeds that of any fleet since 1880, by over two millions (2,000,000) of bushels.

There came into commission forty (40) new first-class steamers, of the largest size, during the year 1887, the majority of which are so large that when loaded it is impossible to get them down the river without causing the public great delay, on account of their great draft and breadth of beam.

As there is no law regulating the loading of these vessels, in former years vessel men used the depth of water on the Washington street tunnel as the standard to load by.

I would respectfully recommend that Section 985 of the Municipal Code be revised, so as to read:

"During the hours between six o'clock in the morning and twelve o'clock midnight, it shall be unlawful to keep open any bridge within the city of Chicago, for the purpose of permitting vessels or other craft to pass through the same, for a longer period at any one time than ten minutes, at the expiration of which period it shall be the duty of the bridge-tender, or other person in charge of the bridge, to display the proper signal and immediately close the same, and keep it closed, in order to allow all persons, teams and vehicles in waiting to pass over said bridge."

By amending Section 985, so as to read as the above section, it will give the vessel dispatcher or bridge-

Digitized by Google

tender the authority to hold vessels more than ten minutes to allow the accumulated traffic and travel of the street to pass over such bridge.

I would respectfully recommend that the Telephone System be extended to include South Halsted street bridge, for the following reasons, viz:

Having no telephone connection with bridges south of Twelfth street, it frequently occurs that the bridge located at this point is opened to allow one vessel to pass north, while other vessels are also moving north between South Halsted and Twelfth streets. There being no telephone report of the movement of these vessels, they are allowed to pass, making two or more openings of bridges from Polk to Wells street, when, with the extension of the system as proposed, one opening of the bridges would answer for all such vessels.

I would also recommend that an order be issued to regulate the operation of pleasure steamers coming from the lake as far as Clark and Wells street bridges, to prevent their winding around before landing (to land head up), as they are always accompanied by more or less other vessels proceeding up the river. Their winding stops these vessels and frequently delays State, Clark and Wells street bridges, and consequently the traffic.

I would report that at this writing there is no adequate system of signals between bridge-tenders

Digitized by Google

and pilots on the Chicago River, and I herewith submit the following code of signals which has been shown and explained to many prominent pilots, superintendents and managers of the various tug and steamboat lines navigating the Chicago River, and has met their approbation:

CODE OF SIGNALS.

1. Red light, pass in.
2. Green light, pass out.
3. Red and green lights, pass both ways.
4. Neither light up, *stop*.
5. The lower lights now in use to remain as they are.

Red and green balls to be used from sunrise to sunset, in the same manner. Bridges having operators to be governed by the same signals from the office, when the bridge is open.

I would further recommend the removal of the Vessel Dispatcher's office from its present location, on account of its being so public and noisy in the season of navigation, as there is at all times one or more of the Anchor Line steamboats at the dock, which prevents our seeing the bridges, and also that the Anchor Line company is building a large warehouse which will totally shut out our view of Wells street bridge. I would suggest that the telephone office be

Digitized by Google

removed to the fire-boat station, at the foot of La Salle street, on the south side of the river. By building an additional story on the fire-boat station it would give the harbor masters a permanent headquarters, as the duties of harbor master and vessel dispatcher are closely allied.

I would also recommend that the ashes and cinders from the steam bridges be hauled away instead of being dumped into the river, as each of the bridges uses from four (4) to six (6) tons of coal per week, and that the sweepings that accumulate on the bridges be carted away by the party who has the contract for cleaning the streets, instead of being thrown into the river by the bridge tenders, and filling the draws of the bridges.

I would also suggest that the Vessel Dispatcher be given authority to pass a vessel to her elevator after 5.00 P. M., to enable her to save storage, as sometimes it occurs, that by holding one from 5.00 to 7.00 P. M. compels them to forfeit from $200 to $500, whereas if they get to the elevator by 6.00 P. M. it would save that amount of money to the ship, and would not be of such vital importance to traffic, in my opinion. Also, to pass a vessel to her dock of discharge or to dry dock, if in a leaking or sinking condition, if in my judgment, it is abolutely necessary to do so.

WATER OFFICE REPORT.

CHICAGO, January, 1888.

HON. GEORGE B. SWIFT,

Commissioner of Public Works.

SIR:—I have the honor of submitting to you the Annual Report of the Water Office for the municipal year terminating December 31, 1887.

When I assumed the duties of Superintendent on May 1st, last, I found that the records had not been fully kept. Inefficient help, lack of discipline and jealousy existed in each department, which by your aid and counsel was soon removed.

The change made by you, in removing the Assessors, Draughtsmen and Permit Department from the Water Office, proved very beneficial, giving despatch and relieving the Water Office of those three sub-departments and enabling clerks to be more rapid and correct.

Annexed to, and being part of the report, will be found statistical tables giving information as to the operations of this department and sub-departments.

Digitized by Google

Total.....		$104,341.08
Decrease.....		$3,414.09

"Section 528, page 168, of the Municipal Code, provides that the Comptroller shall require all officers, charged in any manner with the receipts, collection or disbursement of the city revenues, to make monthly statements in writing under oath, showing in detail all such receipts, collections and disbursements, and file the same in the office of the Comptroller."

This has been complied with from the first of May, since I was appointed Superintendent, and which was never before complied with in this department.

About the tenth of December I ordered forty new ledgers for the use of the Collection Department.

They are now in the hands of the book-binders and will be completed on or about January 15th, 1888.

As soon as possible clerks will be put at work making copies of our present ledgers.

Digitized by Google

It will require three months of labor to make the copies and foot them up so that the amount of assessment from May, 1888, to May, 1889, can be ascertained.

The balance due on the assessment for the year ending May, 1888, is $132,041.97, and I hope to clean this up very close by May 1st.

I also ordered twenty-two new registers for the Meter Department; these are completed and in the hands of the clerks.

The registers for the Meter Department have to be renewed only once in four years, while the ledgers for the Collection Department last only one year.

I desire to particularly call your attention to my special report made to you of the amount of work devolving upon the Assessor and that department, and of the condition of the plat books which form the foundation for water service pipe assessment, that six volumes were destroyed during the great fire of 1871, and the twenty-one volumes saved had only the record of pipes put in since 1868, that the old plat books are in a very dilapidated condition from their constant use and if means are not taken to secure the valuable records they now contain by finishing up the new maps (partially drawn) the loss and inconvenience to this department will be incalculable.

The increase of business necessary to be done every day has retarded the accomplishment of the completion of new plat books.

Digitized by Google

You have granted two additional draughtsmen which will help the department towards completing this desirable work, and as new territory comes in as part of the city new plat books and tracings will have to be prepared and will need two additional draughtsmen to keep business up to the requirements.

I desire also to call your attention to my special report of the "Sub-Permit" Department under Mr. Napier, giving full statistics of the work and especially of the New Mueller Screw Tapping Machines, substituted about the 1st of September, for the old style tapping, the work of which has been very satisfactory, and safer, no complaints that ferrules have blown out, and in that respect showing marked contrast to the many former complaints from that service.

In view of the large extent of territory comprised within the limits of the city, I recommend that you take into consideration the policy of establishing sub-stations in the outlying districts, for the purpose of granting the public better facilities for paying water taxes. Reports to be made at general office every morning before 10 A. M., where all records shall be kept the same as though transacted at water office.

These stations can be located in some police station or fire engine-house; collections can be made without much additional cost, thus saving valuable time and expense to water tax payers.

The time for payment of water tax in my opinion is

Digitized by Google

too limited (being now 15 days for each district of the months of May and June, and November and December), for water takers to avail themselves of the discount of 12½ per cent. and causing great rush at water office during this short period.

I would therefore recommend that the semi-annual payment should cover a period from the 1st day of May to the 31st day of October, and from the 1st day of November to the 30th day of April in each and every year, making four water districts, as follows:

First District. Embracing all the South Division of the city, comprising the 1st, 2nd, 3rd, 4th, 5th and 6th Wards, also 25th Ward.

Second District. Embracing the North Division of the city, comprising the 20th, 21st, 22nd, 23rd and 24th Wards.

Third District. Embracing all that portion of the West Division of the city comprising the 7th, 8th, 9th, 10th, 17th, 18th and 19th Wards.

Fourth District. Embracing all that portion of the West Division of the city comprising the 12th, 13th, 14th, 15th and 16th Wards.

Taxes due and payable as follows:

First District. During months of May and November, respectively, each and every year.

Second District. During months of May and November, respectively, each and every year.

Third District. During months of June and December, respectively, each and every year.

Digitized by Google

Fourth District. During months of June and December, respectively, each and every year.

If time is extended as noted, it will give 30 days in each District instead of 15, to water-takers, to avail themselves of the discount of 12½ per cent., and save rush of tax-payers at Water Office, and facilitate business in the office.

Carrying out these views, I hand you herewith an amendatory ordinance which, if it meets your views, can be sent to the Council for adoption.

The question of an ample water supply to meet requirements is now the all-absorbing topic. The great waste of water which causes scarcity of pressure in upper stories was less the past year than ever before. Inspectors and Leak and Waste force were more prompt in enforcing the ordinance against this waste, but, notwithstanding all the Department could do, it could not be entirely suppressed. Nothing short of a large force like the Police can prevent this waste.

During the months of July and August our Leak and Waste force delivered 3,000 notices to stop waste of water, and in many cases enforced ordinance by shutting off.

We have what is termed "Leak and Waste," "Shut Off," and "Stop Cock" shut off forces.

These were formerly under three foremen, salary $900 each. but were in July put under supervision of J. C. Folz, at a salary of $1,200.

Digitized by Google

Previous to May 1st, I find no record of the work of the Leak and Waste, Shut Off, and Stop Cock shut off forces. Since that date I have had record kept and reported as herewith. I have utilized these forces in sending them out with bills of Water Department, which has materially assisted in prompt payments and collections.

There is also a force for Locating Stop Cocks. This force was under two foremen, at salary of $900 each. On the 1st of July they were placed under John Southwick, at a salary of $1,000, who has fifteen men under him.

These men are divided into gangs, and when the Council passes an order for a street to be improved, the tracings of all lots on the line of property ordered to be improved are given to Mr. Southwick, and he proceeds to dig up the pipes and find out if they are

Digitized by Google

the proper pipes required by ordinance, and making a correct report of all pipes in, and what lots are not supplied, so that a correct assessment of pipes needed may be made.

In some instances this work is very laborious, as in the great fire of 1871 the records of the locations of pipes were burnt, and a new record has to be made from Mr. Southwick's reports.

In addition to this regular work he is required to examine and report all pipes, when there is a dispute in regard to location, and settle the question of the pipes being iron or lead, which in some cases requires digging to the depth of 13 feet, and more in some localities, where streets have been raised.

The stop-cock force of 10 men is used for shutting off water at stop-cocks or taps, where leaks occur or where there are broken pipes.

Where extensive digging is necessary, charges are made against property for that work.

The duties of Water Inspectors, and qualifications required, is referred to in my special report of Water Inspector's Department under Mr. Nickerson.

The draughtsmen are now at work making plat books and tracings for the 25th Ward, preparatory to water assessment from May, 1888, to May, 1889, under the present city ordinance.

With this additional territory to look after it will readily be seen that the expenses will largely increase.

Digitized by Google

There was a large amount of water assessment for frontage rates (where no water is used) being carried along from year to year on books of the Water Office, also erroneous assessments, which we have been endeavoring to clear up by going to County Records, finding owners, notifying same of these assessments, and by compromise have reduced the amount materially, and getting same in shape so annual collections can be made.

We find also by carelessness of Inspectors, that assessments have been made against vacant lots and carried along on books. These we have taken off the books by rebate.

Our books are now kept so that at the end of each month, (or oftener if required) we can show amount delinquent.

The clerks in the Collection Department take pride in keeping their books clean and in good order, as any business house's books, a marked contrast to old books.

It has been the aim of the Superintendent and Chief Clerk to render personal aid to taxpayers, in having their bills properly adjusted through the Assessor, and to see that order and discipline is preserved in every department.

The Water Department of this great metropolis is nearer to the people than any other branch of the

Digitized by Google

city government can possibly be, and it should be the great aim of the authorities to render to its patrons all the facilities that can be devised, so that it will not be a burden upon the people.

Respectfully submitted,

T. N. BOND,
Superintendent.

ASSESSOR'S SUB-DEPARTMENT,

WATER OFFICE.

HON. GEO. B. SWIFT,

Commissioner of Public Works.

DEAR SIR:—I herewith present you special report of the work done by the Water Assessor's Sub-Department of the Water Office, for the year ending December 31st, 1887, showing the amount of work devolving upon the Assessor, MR. PATTISON, and that Department.

Amounts rebated by ordinance of November 21st, 1884, and July 30th, 1885, during the year ending December 31st, 1887.

Municipal and public schools.....	$15,944 61	
Religious, charitable and educational institutions..	12,361 11	
By special order of Council, February 4th, 1887...	173 50	
By special order of Council, June 3d, 1887.....	74 50	
		$28,553 72
Back tax by Ordinance July 30th, 1885.....	$ 71 50	
Back tax by Ordinance November 21st, 1887.....	317 54	389 04
		$28,942 76

This is included in General Statement of Decrease.

The amount reported as "Miscellaneous" is made up of charges for the use of Water outside of the regular assessments, such as sprinkling streets, flooding skating rinks, filling gas tanks, wastage of water, etc., etc., and does not appear on the division books, but is kept in a miscellaneous register for that purpose.

Our annual examinations for water rates are conducted by thirty-six Inspectors constantly employed in house to house examination, the reports of which they return to this office in small books giving the location of each house, with its width in feet, stories in height, how occupied, together with all fixtures for the use of water; these books are first compared with the plat books by a draughtsman, and the location of buildings verified or entered; the book is then passed over to a clerk who compares it with the assessment on the division books, making them to correspond

Digitized by Google

with the Inspector's report by increase or decrease of any item omitted or overcharged, entering such item with the amount on the Inspector's book. The book is then passed to another clerk who enters up the items thus marked, on increase or decrease checks as the case may be; three or four clerks are constantly engaged on this work, and two clerks are constantly engaged in adjusting water bills for the people when paying their water rates; this adjustment of bills is caused by the frequent changes of occupancy of buildings and too frequently by careless Inspectors.

Every pipe in the foregoing statement of contracts has been reported to the Assessor by the Plumbing Inspectors and carefully examined, and compared as to length of pipe and locality, and the Plumber's bills also compared with Inspector's report before being certified by Assessor, to the Superintendent of Special Assessments, for final vouchers to the Contractors, which is the amount shown for contracts, less bill of taps; vouchers of taps and Assessor's cost are issued to credit of the Water Fund.

In preparing the foregoing statement for estimated number of pipes on each street ordered for improvement, we have to make a schedule from our plat books describing the lot or part of lot, block and subdivision of each pipe to be assessed as carefully as would be required for state and county taxes, then the Assessor has to determine the length of the pipes to be assessed, as the mains in which the taps are inserted are generally on the north and west sides of the streets, and about eight feet from the centre of sixty-six feet streets, but uniform in this respect, after this is done the descriptions are entered on permanent register, and the estimated cost of each pipe entered up, and a copy taken for the use of Superintendent of Special Assessments. At any time before we advertise for letting, owners are permitted to put in the pipes as assessed, which fact the Assessor has to certify to Superintendent of Special Assessments, so that he may cancel the assessment on the warrant for all pipes so put in, or found in, by examination; all this requires constant care to avoid the illegal sale of lots already supplied.

It will be observed that the plat books form the foundation for water service pipe assessment, and it being remembered that six volumes were destroyed during the great fire of 1871, and the twenty-one volumes saved had only the record of pipes put in since 1868; a great many pipes put in before that

Digitized by Google

time do not appear on the plats, consequently we assess a great many lots already supplied, which we have to withdraw when pipes are found in. All pipes put in since the "fire" are carefully entered by scale on the plats, and all that are found by examination since are so entered up.

I regret to state that our old plat books are getting to be in a very dilapidated condition from their constant use and careless handling by all branches of the Water Department, and if means are not taken to secure the valuable records they now contain, by finishing up the new maps partially drawn, the loss and inconvenience to this Department will be incalculable. During the past year the immense growth of the city has kept the draughtsmen so busy with current work that very little has been done on the new plats, and now the recent annexed territory will greatly increase the routine work in that direction.

Respectfully submitted,

T. N. BOND,

Superintendent.

PERMIT SUB-DEPARTMENT,

WATER OFFICE.

CHICAGO, January, 1888.

HON. GEO. B. SWIFT,

Commissioner of Public Works.

DEAR SIR:—I herewith submit a statement of the work of the Permit Department, under the supervision of HENRY G. NAPIER, Chief Clerk of Permits, for water supply issued, together with the receipts and expenditures of this Department during the fiscal year, ending December 31, 1887.

The first of September, at your suggestion, the Department purchased two Mueller Screw Tapping Machines. The working of the Screw Tapping Machines has so far been very satisfactory. No com-

Digitized by Google

plaints have come in that the ferrules have blown out, and in that respect shows a marked contrast to the many former complaints from that source.

On the other hand, it must be said, that with the new machines we cannot, by one third, put in as many ferrules per day as by the old method, thus necessitating an increase in the number of tappers and machines when our busy season opens early in the Spring. Yet as the property owners pay for the work, they should be supplied with the very best and safest that can be procured, though expense may be more.

I would most respectfully suggest that the driving or smooth-bore ferrules, now on hand, be hereafter used only for retapping in replaced street mains, thereby putting all new applicants for ferrules on the same footing, and also expediting the insertion of ferrules for our Pipe Foreman.

Accompanying this report you will find inventory of property connected with this Department.

Respectfully submitted,

T. N. BOND,

Superintendent.

REPORT OF
WATER INSPECTOR'S FORCE.

W. H. NICKERSON, CHIEF.

CHICAGO, January 1, 1888.

HON. GEO. B. SWIFT,

Commissioner of Public Works.

DEAR SIR:—That you may fully understand the work devolving upon the Water Inspectors, I desire to make a special report of their duties, as it is the very foundation of our water assessments.

Attached hereto you will find recapitulation of monthly reports made to me of work done from August, 1887, to December 31, 1887.

I regret not being able to give you report for the whole year, but up to August no reports were kept.

There are at present thirty-seven persons employed on the Water Inspector's force, consisting of one Chief Inspector, one Clerk and Book-keeper, thirty-five Inspectors.

It is intended that an annual examination of the entire city shall be made. The Inspector's force is divided into two classes, about in the ratio of one to

Digitized by Google

six. The larger portion is employed constantly on annual examinations, usually working in pairs, for the better convenience of measuring, locating, etc.

The location of each and every house is taken as accurately as if it were to be transferred to a purchaser. If more than one house is found upon a lot, each must be accurately located and described on the particular portion of the lot, or lots, as the case may be, where found.

The front of the house is accurately measured and stories counted. The house is then entered (if permission can be obtained from the occupants), and an account of all water-closets, baths, urinals, wash-basins (permanent sinks), in fact every contrivance for the use of water supplied by the city, is carefully noted and located on the particular floor where found. Also of all machinery and machine shops—every building, of whatsoever name or nature; horses, mules, liveries, etc.; hose, sprinklers, etc., wherever found; extra persons in houses; water-closets in yards, when the same are found in the houses, on the same premises; water-closets connected with the city water, accommodating stores, work-shops, etc.

If permission to enter buildings is refused (as is sometimes the case in private dwellings), then the Inspector must obtain his information as best he may. Tracings, showing the numbers of the lots and streets, are furnished by the Assessors' Department. With

Digitized by Google

these and his memoranda-book, tape-line, etc., the Inspector goes from house to house and from block to block, from ward to ward, until the entire city is traversed.

Another duty of the "Annual Inspectors" is to look after new pipe. When the people of any new street, or old one, for that matter, desire to have a water-pipe laid, they petition the city to that effect. The Assessor (of water) furnishes the Inspector with the name of the street or streets, and the number of feet on each where water-pipe is wanted. The Inspector finds out the number of houses already erected, or in the course of erection, or likely to be erected in the near future, on the tract designated. If his report is fair, the pipe is put down; after which the Inspector is called upon to go over the ground again, in the same manner as in the annual examinations, locate every building, and ascertain what facilities they contain for using the city water.

The smaller division of the Inspector's force is called "Special," from the fact that their work is "special." When an examination is found to differ with the one made on the year previous on the same property, a "Special" is sent out to ascertain whether the difference really exists, or whether a mistake has been made.

In paying their water tax many people complain that their tax is too high, and insist that they have

Digitized by Google

not got so many water-closets, or baths, or hose, or animals, and for this many Specials are sent out each day. The "Special" should be an expert, as in addition to his other duties he is frequently detailed to take charge of or perform some of the most difficult work that is given to the Inspector to perform.

By the foregoing outline of the duties of Water Inspector, it is apparent that intelligence, education, sobriety, patience and refinement are necessary in the make-up of an efficient Inspector.

I am pleased to say that the present force of Inspectors is largely made up of such men, and trust, as they now have become familiar with the duties, little or no change will be made, unless for cause.

Owing to the large extent of territory annexed and work to be done, this force can profitably be increased five more; and in the near future, when the Twenty-fifth Ward has to pass examination, more will be required.

Inspectors' salaries,	1886.....	$36,231 40
" "	1887.....	32,722 26

Yours respectfully,

T. N. BOND,

Superintendent.

SEWERAGE DEPARTMENT.

CHICAGO, JANUARY 1, 1888.

GEO. B. SWIFT, ESQ.,

Commissioner of Public Works.

DEAR SIR:—I have the honor herewith to transmit the Twelfth Annual Report of the Bureau of Sewers under the Department of Public Works, being the thirty-second yearly statement of the amount of money expended and work accomplished in the several branches of this Bureau, during the year 1887, as well as the total expenditures for constructing and maintenance of the same from the establishment of the system in the year 1855, to 1887, inclusive.

Digitized by Google

The cost to the city, of the work done in the several branches of this Bureau during the year just closed, is as follows :

For building new sewers and catch-basins	$184,577.04
For house drains	23,541.27
For repairs sewers and catch-basins	8,513.69
For cleaning sewers and catch-basins	50,264.65
For street intersections	31,979.06
For salaries	16,884.13
For office expenses	658.94
TOTAL COST TO THE CITY	$316,418.78

For a detailed statement of the amount of work done, please see the annexed tables.

Cost of cleaning sewers and catch-basins								$49,830.99	
Miscellaneous bills, repairs of tools, etc.								433.66	
TOTAL COST OF CLEANING SEWERS AND CATCH-BASINS								$50,264.65	

Digitized by Google

The sewers cleaned during the past year have been mostly those that have not been cleaned before for several years, and consequently were very dirty, and were costly to clean.

The stage of the water in the lake has averaged about two feet lower for the past year than that of previous years, in consequence of which we have been enabled to clean the sewers that for several years past have been bore full of back water from the lake, making it impossible to clean them thoroughly.

The expense of cleaning catch-basins is increasing very rapidly, as the deposit taken from them has to be hauled a long distance to find suitable dumping ground. In years past the deposit taken from catch-basins along unimproved streets could be dumped near the basins, without complaint from people residing in the vicinity; now the deposit from nearly every basin cleaned has to be hauled to the dump, which in many cases is from two to three miles away from the basins. In the near future some other means will have to be provided for the disposal of material taken from sewers and catch-basins; even now I am of the opinion that it can be taken out of the city by cars and disposed of nearly as cheap as it can be hauled to the dumps.

STATEMENT SHOWING THE VALUE OF THE AMOUNT OF MATERIAL AND STOCK ON HAND AND THE UNEXPENDED BALANCE STANDING TO THE CREDIT OF THE SEWERAGE FUND JAN. 1, 1888.

Wooden Covers and Lumber	$ 4,602.62
Iron Covers	1,848.75
Sewer Pipe	2,733.15
Brick	1,197.96
Sand	101.00
Cement	10.50
Stock (Machinery, Tools, etc.)	5,500.00
Unexpended Balance	34,661.93
Of this amount there is due private parties holding certificates for money advanced to construct sewers	10,678.07

In closing this report I desire to acknowledge my obligations for the uniform courtesy and support of the Commissioner and other officers of the Department in the discharge of the duties of my position; also to testify to the faithfulness, industry and zeal with which the gentlemen connected with this Bureau have discharged their various duties.

Respectfully submitted,

O. H. CHENEY,

Superintendent of Sewers.

BUREAU OF STREETS.

CHICAGO, December 31st, 1887.

GEO. B. SWIFT, ESQ.,

Commissioner of Public Works.

DEAR SIR :—I have the honor to submit herewith the Twelfth Annual Report of the Bureau of Streets. It contains a general review of the work accomplished during the year, under the supervision of this Bureau; also street railway extensions, and a complete list of streets occupied by railway tracks in the several divisions of the city, operated and controlled by the different horse and cable railway companies.

STREET AND ALLEY IMPROVEMENTS.

The following tables show the progress made in Street and Alley improvements, the character of pavement laid on each street, the total length in lineal feet and miles, as well as surface measurement in square yards:

SUMMARY OF STREETS IMPROVED.

PAVEMENT.	North Division.	South Division.	West Division.	Total Miles.
Cedar Blocks	4.77	8.00	18.36	31.13
Granite Blocks		2.62	.23	2.85
Macadam		1.53	.38	1.91
Asphalt Blocks		.15		.15
Sheet Asphalt	.22			.22
Cinders			.44	.44
Iron		.05		.05
Total Miles	4.99	12.35	19.41	36.75

In addition to the above, streets were planked to the extent of 1.56 miles. Curbing and filling on unpaved streets, 4.68 miles.

The following shows the kind of paving in each division of the city at the close of the year:

	Wooden Blocks.	Macadam.	Medina Stone.	Granite Blocks.	Sheet Asphalt.	Asphalt Blocks.	Gravel.	Cinders.	Iron.	Grand Total Miles.
North	49.79	1.19	.49	.04	2.19		.42	1.26		55.38
South	62.05	9.15	4.15	9.71	.33	4.11	4.38	.36	.05	94.29
West	132.64	19.78	.39	.23	.82		3.64	8.29		164.79
Total	244.48	30.12	5.03	9.98	3.34	4.11	7.44	9.91	.05	314.46
Less repaving done in 1887.	7.61									7.61
Total Miles	236.87	30.12	5.03	9.98	3.34	4.11	7.44	9.91	.05	306.85

Digitized by Google

The total number of miles of pavement laid each year, from the introduction of street paving in 1855 to the present date, is given in the following review:

YEAR.	Number of Miles.	YEAR.	Number of Miles.
1855	1.72	1872	1.82
1856	.26	1873	10.19
1857	2.62	1874	9.07
1858	7.20	1875	11.49
1859	5.70	1876	10.50
1860		1877	12.29
1861	.69	1878	11.01
1862	2.57	1879	6.83
1863	2.00	1880	16.84
1864	2.40	1881	24.52
1865	2.03	1882	24.95
1866	8.87	1883	22.49
1867	11.37	1884	34.52
1868	5.46	1885	38.06
1869	18.32	1886	43.66
1870	19.96	1887	36.75
1871	25.63	Total No. of Miles	431.79

Of this amount 124.94 miles have been repaved during the same period, which reduces the actual amount of improved streets within the corporate limits at this date to 306.85 miles.

LUMBER.

The following table shows in detail the amount of lumber used by the division foremen in the repairs and construction of aprons, culverts, crossings, sidewalk intersections and repairs, to which is added the

Digitized by Google

amount of lumber used in the construction of sidewalks for which special assessments were levied:

For What Used.	South Division.			West Division.			North Division.		
	No.	Lumber.		No.	Lumber.		No.	Lumber.	
		No. Feet Pine.	No. Feet Oak.		No. Feet Pine.	No. Feet Oak.		No. Feet Pine.	No. Feet Oak.

Grand total square yards	216,199

UNIMPROVED STREETS.

In the work of grading and ditching, the unimproved streets have been kept in as good, passable condition as the money at disposal would permit.

The total length of streets graded and ditched by the division foremen amounts in the aggregate to about 254 miles.

The following streets were planked (all of the material used being furnished by property owners in the localities mentioned).

IMPROVED STREETS.

STREET CLEANING.

The contract for sweeping and cleaning the improved streets was awarded to John S. Cooper, on April 7th, 1887.

The work of cleaning commenced on April 9th, and was drawn to a close November 30th, 1887.

The contract price per mile was $23.99, and the total cost of the work under the contract amounted to $84,298.88.

The number of miles cleaned each month under contract during the years 1886 and 1887, and the cost of the work, is shown in the following comparative statement:

Digitized by Google

MONTH.	1886. Miles.	1887. Miles.	1886. Cost.	1887. Cost.
April	285.61	362.98	$ 8,137 02	$ 8,707 89
May	492.02	567.24	14,017 65	13,608 08
June	521.71	565.22	14,863 51	13,559 62

PERMITS FOR OPENING STREETS.

Thirteen hundred and thirty-six (1,336) permits were issued to sundry parties to open improved streets. A cash deposit, covering cost of replacing pavements, etc., to their original condition, was made on each permit.

This does not include openings made on improved streets by gas companies and sundry other companies under general deposit, where the work of replacing pavements was done by contractors, subject to inspection and acceptance of the department.

A summary is given herewith:

MONTH.	No. of Permits Issued.	MONTH.	No. of Permits Issued.
January	25	August	173
February	28	September	131
March	70	October	171
April	121	November	155
May	124	December	106
June	102		
July	130	Total	1336

Average number of permits issued each month, 111.

Number of permits issued for opening improved streets on which deposits were made (not including openings by Gas Companies and other corporations under general deposits)	1,336
Number of permits issued for opening unimproved streets	3,153
Total	4,489

Amount of cash deposit made during the year	$28,726 50
Amount retained as costs for repaving and inspection	10,618 24
Amount rebated to depositors	17,778 26
Average amount of cash deposit	21 51
Average amount retained for costs	7 95

PERMITS FOR USE OF STREETS.

Twelve hundred and nine (1,209) permits were issued to sundry parties to occupy streets for the purpose of depositing materials thereon during the construction of buildings.

The number of permits issued monthly, the amount of cash deposits, and revenue received for use of streets is given in the following statement:

MONTH.	No. of Permits Issued.	MONTH.	No. of Permits Issued.
January	40	August	148
February	78	September	119
March	149	October	86
April	119	November	65
May	68	December	63
June	75		
July	199	Total	1,209

Average number of permits issued each month, 101.

Amount of cash deposit made during the year 1887	$14,555 00
Amount retained for use of street as per Sec. 1,104 Municipal Code.	4,963 00
Amount rebated to depositors	6,247 00

PARKS.

The money at the disposal of the department for the care of parks was used in their maintenance, including the repairing and construction of fences, fountains and sidewalks, painting outhouses, seats, bridges, lamp posts, etc.

Special improvements were made as follows:

Douglas Monument Square, wire fence	$ 170 50
Ellis Park, concrete sidewalk	358 27
Washington Square, new fountain, basin repaired, painting, etc.	703 08
Campbell Park, trees, plumbing, etc.	188 00
Holstein Park, expended for filling	575 40
Total	$1,995 25

With these exceptions, the ordinary work of taking care of the parks makes up the sum of the expense as shown in the book-keeper's financial statement.

HOUSE MOVING.

Licenses were issued to forty-six house-movers.

During the year nine hundred and thirty-five permits were granted to move buildings. Of this number eight hundred and seventy-eight were frame, and fifty-seven brick buildings, the total frontage aggregating 18,086 lineal feet.

A general review of the work apportioned by divisions, the number of buildings moved each month, and the cash receipts from this source, is shown in the following tabulated statement:

MONTH.	No. of Permits.	Division.			Feet Frontage.	Average Frontage.	Frame.	Brick.	Heights.			Cash Receipts.

CHICAGO, December 31st, 1887.

MR. GEO. W. DEAL,

Superintendent of Streets.

DEAR SIR:—I herewith present my Annual Report of Street Lamps, for the year 1887. At the close of the year there were, including those on bridges, viaducts, parks and boulevards, 17,528 gas lamps, and 4,018 oil lamps in the city, as follows, to wit:

GAS LAMPS.

Division.	No. in City, January 1, 1887.	No. erected during year 1887.	Total.
North.....	2,796	128	2,924
South.....	4,185	417	4,602
West	9,005	997	10,002
Total.....	15,986	1,542	17,528

OIL LAMPS.

Division.	No. in City, Jan. 1, 1887.	No. erected during year 1887.	Total.	Less number discontinu'd where gas mains have been laid during the year 1887.	Total.
North.....	618	8	626	23	603
South	1,285	150	1,435	221	1,214
West.....	2,145	367	2,512	311	2,201
Total.....	4,048	525	4,573	555	4,018

Digitized by Google

The following statement shows the number of gas lamps in the city at the commencement and close of each year, from the organization of the Department of Public Works in 1876, to date:

YEAR.	WEST DIVISION.			SOUTH DIVISION.			NORTH DIVISION.		
	No. of Lamps Jan. 1.	No. added.	Total.	No. of Lamps Jan. 1.	No. added.	Total.	No. of Lamps Jan. 1.	No. added.	Total.
1876.....	5,160	202	5,362	2,965	92	3,057	2,095	39	2,134

1887.....	2,145	56	2,201	1,285	Less 70	1,214	618	Less 15	603

Total number added during the past six years:

West Division.....	1,944
South "	1,127
North "	373
	3,444
Total number of Oil lamps in city January 1, 1881.....	574
Total number of oil lamps in city December 31, 1887.....	4,018

The number of lamps glazed to replace broken glass was 45,737, of which 25,511 were in the west division, and 20,226 in the north and south divisions; the average per day being about 70 in the west division and 55 in the north and south divisions combined. In this work there was used 162 boxes of

Digitized by Google

door lights of glass, 191 boxes top lights and 774 boxes side lights.

In glazing the new lamps for posts erected during the year, there was used 41 boxes of door lights, 96 boxes of top lights and 125 boxes of side lights. The total number of boxes of glass used was 1,389, of 50 feet each.

The number of old lamps repaired and painted was 896; of these 593 were for the west division and 303 for the north and south divisions.

Two thousand six hundred and twenty-eight (2,628) new lamps were made. Included in this number are fifteen hundred and ninety-three (1,593) guide lamps.

All of the lamps now used by the city are of the "Stewart Patent."

Glass street signs have been put in most of the corner gas lamps, and tin signs on the oil lamps. The contract will be completed within a few weeks.

Respectfully submitted,

JOHN STEWART,

Superintendent of Street Lamps.

SIDEWALKS.

The number of miles of sidewalks rebuilt during the year, including wood, stone and concrete, also miles of sidewalk repaired is shown in the following table:

DIVISION.	MATERIAL.			Total Miles.	Sidewalks repaired.	Grand Total Miles.
	Wood.	Stone.	Concrete.			
North.....	7.89	1.29	.46	9.64	15.21	24.85
South.....	13.67	6.77	1.16	21.60	7.57	29.17
West.....	93.64	1.77	.50	95.91	13.51	109.42
Total.....	115.20	9.83	2.12	127.15	36.29	163.44

In addition to the above there has been constructed 42.50 miles of sidewalk on ground not heretofore covered by sidewalks, distributed in each division as follows:

North Division..... 4.00 miles.
South Division..... 6.00 "
West Division.....32.50 "

Making a total of 205.94 miles of sidewalk built, rebuilt and repaired, during the year.

Of the above there has been built of wooden walks by the city, under special assessment, 10.25 miles.

The total number of miles of sidewalks under the control of the city and the West, South and Lincoln

THE "TOWN OF CHICAGO,"

(John H. Kinzie, Gurdon S. Hubbard, Ebenezer Goodrich, John K. Boyer and John S. C. Hogan, first trustees), was incorporated by act of February 11, 1835. It comprised all that territory covered by sections 9 and 16, north and south fractional section 10, and fractional section 15, in town 39, north range 14 east of the third principal meridian; "*Provided*, that the authority of the board of trustees of the said town of Chicago shall not extend over the south fractional section 10, until the same shall cease to be occupied by the United States."

THE "CITY OF CHICAGO,"

Incorporated by act of March 4, 1837, comprised "the district of country in the county of Cook, etc., known as the east ½ of the southeast ¼ of section 33, town 40, range 14 east, and fractional section 34, town 40, north range 14 east; also the east ¼ of sections 6, 7, 18 and 19, all of fractional section 3, and of sections 4, 5, 8, 9, and fractional section 10, (except the southwest fractional ¼ thereof, occupied as a military post, until the same shall become private property), fractional section 15, sections 16, 17, 20, 21, and fractional section 22, town 39, north range 14 east."

Digitized by Google

FIRST EXTENSION OF CITY LIMITS.

Act of February 16, 1847, provides: That the district of country in the county of Cook, etc., known and described as follows, to wit: All that part of township 39, north range 14, east of the third principal meridian, which lies north of the north line of sections 27, 28, 29 and 30 of said township, and the east ½ of section 33, town 40, north range 14 east, and fractional section 34, town 40, north range 14 east, shall hereafter be included in, constitute and be known by the name of "City of Chicago."

SECOND EXTENSION OF CITY LIMITS.

Act of February 12, 1853, provides: That the corporate limits and jurisdiction of the city of Chicago shall be and the same are hereby extended so as to embrace and include within the same the several tracts of land hereinafter described, which shall be deemed parts of the divisions of the said city named in connection therewith, as follows:

North Division.—All those parts of sections 31 and 32, town 40, north range 14 east, lying east of the center of the north branch of the Chicago River and the west half of section 33, in same township and range.

South Division.—All of fractional section 27, town 39, north range 14 east, and so much of the shore

Digitized by Google

and bed of the lake as lies within one mile east of said section, and all of that part of sections 28, same township and range, lying south and east of the south branch of the Chicago River.

West Division.—All those parts of sections 28, 29 and 30, town 39, north range 14 east, lying north of the south branch of the Chicago River.

THIRD EXTENSION OF CITY LIMITS.

Act of February 13, 1863, provides: The corporate limits and jurisdiction of the city of Chicago shall embrace and include within the same all of township 39, north range 14 east of the third principal meridian, and all of sections 31, 32, 33 and fractional section 34, township 40, north range 14 east, together with so much of the waters and bed of Lake Michigan as lies within one mile of the shore thereof, and east of the territory aforesaid.

FOURTH EXTENSION OF CITY LIMITS.

Act of February 27, 1869, provides: That the territorial limits of the city of Chicago shall be and are hereby extended as follows: That part of section 30, township 40, north range 14 east, which lies west of the north branch of the Chicago River; sections 1, 2, 11, 12, 13, 14, 23, 24, 25, 26, and that part of sections 35 and 36 lying northwest of the center of the

Digitized by Google

Illinois and Michigan Canal, all in township 39, north range 13 east, shall be and are hereby added to the city.

The city including the first, second, third and fourth extensions covers thirty-six square miles.

FIFTH EXTENSION.

Act of May 16, 1887, provides, That the territorial limits of the city of Chicago shall be and are hereby extended as follows: That section 36, town of Jefferson, township 40, north range 13, shall be and is hereby added to the city. One square mile.

(PROPOSED) SIXTH EXTENSION.

Act of November 21, 1887, provides: That, as by an election held on the eighth day of November, 1887, a portion of the town of Cicero was annexed by the city of Chicago, the corporate limits and jurisdiction of the city of Chicago shall embrace and include within the same the part of the town of Cicero described as follows: All that part of sections 35 and 36 in township 39, north range 13 east of the third principal meridian, lying southeast of the center of the Illinois and Michigan Canal. Six and one-fourth square miles.

ALSO:

Act of December 5, 1887, provides: That the part of the town of Jefferson known as section 25, township

Digitized by Google

40, north range 13 east of third principal meridian, voted by a regular election on the eighth day of November, 1887, be and is hereby added to the city of Chicago. One square mile.

ALSO :

Whereas, by a legal election held on the eighth day of November, 1887, and by a resolution of the Board of Commissioners of Cook County, passed December 3, 1887, certain territory hereinafter described, formerly forming a part of the town of Hyde Park, was declared to be annexed to the town of South Chicago, be it ordained by the City Council of the city of Chicago: That all of fractional section 2, sections 3 and 10, fractional sections 11, 12 and 13, sections 14, 15, 22 and 23, fractional section 24, and sections 25, 26, 27, 34, 35 and 36, all in township 38, north range 14 east of third principal meridian; and fractional sections 19, 29 and 30, section 31, and fractional section 32, all in township 38, north range 13 east of third principal meridian; also, sections 1, 2, 3, 13 and 12 north, and sections 12 and 13 south of the Indian boundary line, and sections 24, 25 and 36, in township 37, north range 14 east of third principal meridian; also, fractional sections 5 and 6 north, and fractional sections 5 and 6 south of Indian boundary line, fractional sections 7, 8 and 17, sections 18 and 19, fractional sections 20 and 29, sections 30, 31 and 32, in township 37, north

Digitized by Google

range 15 east of third principal meridian, all in Cook county, State of Illinois, shall be and are hereby added to the city of Chicago. Thirty-four and three-fourths square miles. All making the total area of the city of Chicago seventy-nine square miles.

BUREAU OF SPECIAL ASSESSMENTS.

CHICAGO, December 31, 1887.

HON. GEORGE B. SWIFT,

Commissioner of Public Works.

DEAR SIR:—I submit herewith, in tabular form, a statement of Special Assessments made in this Department during the past year, with a summary of the estimated cost of the same, also the amount of Special Assessments made in each year during the past twenty-seven years.

The annexation of the new territory made during the present year will necessarily increase the labor of this Department to a large degree, and I again respectfully call attention to the suggestions made in my last annual report, and bespeak your assistance in carrying them out.

The following list shows the total of assessments made in each year since 1861:

For the year ending April 1, 1862	$ 42,635.49
For the year ending April 1, 1863	46,493.67
For the year ending April 1, 1864	389,169.31
For the year ending April 1, 1865	103,576.35
For the year ending April 1, 1866	802,574 56
For the year ending April 1, 1867	317,206.18
For the year ending April 1, 1868	1,354,436.48
For the year ending April 1, 1869	2,395,683.03
For the year ending April 1, 1870	2,836,852.48
For the year ending April 1, 1871	2,359,835.89
For the year ending April 1, 1872	62,222.25
For the year ending April 1, 1873	
For the year ending April 1, 1874	749,460.27
For the year ending April 1, 1875	723,254.42
For the nine months ending January 1, 1876	60,585.72
For the year ending January 1, 1877	1,516.081.07
For the year ending January 1, 1878	124,498.48
For the year ending January 1, 1879	284,900.45
For the year ending January 1, 1880	588,963.44
For the year ending January 1, 1881	980,895.50
For the year ending January 1, 1882	1,227,169.71
For the year ending January 1, 1883	1,395,372.98
For the year ending January 1, 1884	2,232,757.04
For the year ending January 1, 1885	2,857,905.28
For the year ending January 1, 1886	2,889,544.80
For the year ending January 1, 1887	3,307,567.99
For the year ending January 1, 1888	3,160,474.67
Total for twenty-seven years	$32,830,117.51

DEPARTMENT OF PUBLIC WORKS.

ARTICLE I. The Commissioner of Public Works.
II. The Commissioner's Secretary.
III. The City Engineer.
IV. The Superintendent of Streets.
V. The Superintendent of Water.
VI. The Superintendent of Sewerage.
VII. The Superintendent of Special Assessments.
VIII. The Superintendent of Maps.

ARTICLE I.

THE COMMISSIONER OF PUBLIC WORKS.

551. There is hereby established an executive department of the municipal government of the city of Chicago, which shall be known as the department of public works, and shall embrace the commissioner of public works, a secretary to said commissioner, the city engineer, the superintendent of streets, the superintendent of water, the superintendent of sewerage, the superintendent of special assessments, the superintendent of maps, and such other assistants and employes as the city council may, by ordinance, prescribe and establish.

552. There is hereby created the office of commissioner of public works, who shall be the head of said department of public works, and shall hold his office for the term of two years, and until his successor shall be appointed and qualified. He shall have the management and control of all matters and things pertaining thereto; and the appointment and removal, with the consent of the mayor, of the subordinate officers named in the last preceding section; and said subordinate officers may, with the consent of the commissioner, appoint and remove all employes in their respective departments.

Digitized by Google

553. Said commissioner shall appoint all other employes in said department, and in addition to the number of clerks, assistants and employes regularly employed and provided for by ordinance, may appoint such other clerks, assistants and employes as he may deem necessary to properly perform the work in said department; and he may remove any such assistant, clerk or employe at his pleasure.

554. Said commissioner of public works shall be appointed by the mayor, by and with the advice and consent of the city council, on the first Monday in May, 1881, or as soon thereafter as may be, and biennially thereafter.

555. Said commissioner, before entering upon the duties of his office, shall execute a bond to the city of Chicago, in the sum of fifty thousand dollars, with such sureties as the city council shall approve, conditioned for the faithful performance of the duties of his office.

556. It shall be the duty of said commissioner to require good and sufficient bonds to be given by all subordinate officers and employes in said department of public works who shall receive or have the care, custody or handling of any moneys belonging to the city of Chicago; which said bonds shall be approved by the mayor.

557. Said commissioner shall have charge of all public improvements, commenced or to be commenced by said city, and of all special assessments; and shall have power, subject to the ordinances of the city, to regulate and control the manner of using the streets, alleys, highways and public places of the city, for the erection of telegraph poles or other poles and posts; for the laying down of gas, water or steam pipes and sewers authorized by law or the ordinances of the city, and to determine the location thereof; and to cause the prompt repair of the streets, alleys, highways and public places, whenever the same are taken

Digitized by Google

up or altered: *Provided, however*, that nothing herein contained shall be construed to repeal, or in any manner conflict with any provision of this ordinance creating the department of buildings: *and provided, further*, that the abatement and removal of all nuisances shall be in special charge of and under the control of the department of health.

558. It shall be the duty of said commissioner of public works, subject to the provisions hereof and the ordinances of the city, to take special charge and superintendence of all streets, alleys, lanes and highways in the city of Chicago, and of all walks and cross-walks, bridges, viaducts, docks, wharves, public places, public landings, public grounds and parks in said city; of all markets, market places and market houses; of all engine houses, hospitals, armories, and all other public buildings in the city, belonging to the city, and of the erection of all public buildings; of all lamps and lights for the lighting of streets, alleys, lanes, highways, bridges, viaducts, parks, public places and public buildings of the city, and of the erection and repair of such lamps and lights; of all works for the widening, deepening or dredging of the Chicago river and its branches, and of the harbor of said city; of all sewers and works pertaining thereto; and of the water-works of said city; and he shall collect all water rents, water taxes or assessments, water licenses and permits, and all sewerage permits and licenses.

559. Said commissioner shall control and direct all expenditures to be made by the department of public works; shall sign and draw his requisition upon the comptroller for the payment of all bills and accounts therefor which in his judgment are correct, and which may be duly certified by the superintendent under whose supervision the expenditure was incurred.

560. No payment shall be made on any work or job done by contract, for any extra work not specified in the contract, unless such extra work shall have been done by the written order

Digitized by Google

of the commissioner of public works, to be annexed to such contract, directing the same, and stating that such work is not included in the contract: *Provided*, that any order given under this section shall state what the extras are, and that such extras are necessary for the proper completion of, or for the security of, the work previously done, and the reasons therefor.

561. All moneys payable by the corporation, for work done or supplies furnished by contract or otherwise, under the department of public works, shall be paid by the comptroller upon the requisition of the commissioner of public works.

562. All contracts for the making of any public improvement to be paid for in whole or in part by special assessment, and any work or other public improvement, when the expense thereof shall exceed the sum of five hundred dollars, shall be let to the lowest responsible bidder, after advertising the same, and shall be approved by the mayor; but any such contract may be entered into by the said commissioner without advertising for bids, and without such approval, by a vote of two-thirds of all the aldermen elected.

563. Whenever any public improvement shall be ordered by the city council, which is to be paid for by special assessment, and the assessment for the same shall have been finally confirmed, and one-half of the special assessment shall have been paid into the city treasury, the commissioner of public works shall advertise in some newspaper printed in the city of Chicago, of general circulation, for proposals for doing said work: *Provided, however*, a contract for said work may be made before one-half of the special assessment is collected, if authorized by a vote of two-thirds of all the aldermen elected: *and provided, also*, when a portion of the work on any public improvement is done by private contract, under the authority of the city council, the remainder of the work upon such public improvement may

Digitized by Google

be let at any time after the assessment thereof shall have been ordered by the city council. A plan or profile of the work to be done, accompanied with specifications for the doing of the same, shall be first placed on file in the office of said department, before any such advertisement shall be made, which said plan, profile and specification shall, at all times, be open for public inspection; such advertisement shall be published on five separate days, the first publication to be not less than ten days before the day fixed for opening said proposals, and shall state the work to be done.

564. In all cases, the bids for doing any work, or making any public improvement, shall be sealed bids, directed to said department, and shall be accompanied with a deposit, the amount of which shall be fixed by said commissioner, and named in said advertisement, and which shall not exceed five per cent. of the estimated cost of the improvement or work to be done, nor be less than the sum of one hundred dollars. Said deposit shall be in money, or a certified check upon some Chicago bank, in good standing, payable to the order of said commissioner, and shall be forfeited to the city in the event that the bidder shall neglect or refuse to enter into a contract (with approved sureties) to execute the work for the price mentioned in his bid, and according to the plans and specifications, in case the contract shall be awarded to him. Said bids shall be opened at the hour and place mentioned in said notice; and should said bid or bids be rejected, or should it become necessary for any other reason, to re-advertise for proposals to do said work, such subsequent advertisement may be, at the discretion of said commissioner, for three instead of five days, as required in the first instance. Said commissioner may, in said advertisement, reserve the right to reject any and all bids.

565. All contracts, exceeding in amount the sum of five hundred dollars, for work, materials, or supplies relating to any

Digitized by Google

of the matters under the cognizance of the department of public works, shall be let by the commissioner of public works to the lowest reliable and responsible bidder or bidders, whose bid does not exceed the estimate, and bonds to be approved by the commissioner, shall be taken for the faithful performance thereof; all such contracts shall be executed in triplicate by the commissioner of public works, on the part of the corporation, and by the contractor; one original copy so executed shall be kept and filed in the office of the commissioner of public works, one shall be filed in the office of the comptroller, and the third shall be given to the contractor. All contracts, and bonds so taken, shall be in the name of, and run to the city of Chicago; and every contract, for a sum greater than five hundred dollars, shall have the consent, in writing, of the mayor endorsed thereon, and shall be countersigned by the city comptroller.

566. No contract shall be made for any work or supplies relating to any of the matters within the cognizance of the department of public works, unless such work or supplies shall have been authorized by the city council, except that whenever any such work or supplies shall be necessary, and the total cost thereof shall not, in any one case, exceed five hundred dollars, the commissioner of public works may cause the same to be done or furnished, under the supervision of the appropriate officer of the department; but no such expenditure shall be made without the written order of the commissioner of public works, through his secretary, which order, when filled, shall be returned and filed as a voucher in said department, with the bill upon which payment was made.

567. In all cases, before such supplies, work, materials or necessaries of any kind shall be ordered or purchased by said department, exceeding in amount the sum of two hundred dollars, and not more than five hundred dollars, said commissioner shall first obtain, in writing, at least three informal bids to furnish

Digitized by Google

the same, which said bids shall accompany, and be filed in every case, with the voucher upon which the requisition for payment of same is issued.

568. In all contracts executed by said commissioner, on behalf of the city, the right shall be reserved to said commissioner to finally decide all questions arising as to the proper performance of said work; and in case of improper construction, or of non-compliance with the contract in any manner, to suspend said work at any time, or to order the partial or entire reconstruction of said work if improperly done, or to declare the contract forfeited, and to re-let the same without further advertisement; and to adjust the difference of damages or price (if any there be) which the contractor or contractors failing to properly construct such work in such cases of default, should pay to the city, according to the just and reasonable interpretation of said contract.

569. In cases where the contractor or contractors shall proceed to properly perform and complete their said contracts, the said commissioner may from time to time, as the work progresses, grant to said contractor or contractors an estimate of the amount already earned, reserving fifteen per cent. therefrom, which shall entitle the holder or holders to receive the amount that may be due thereon when the money applicable to the payment of such work shall have been collected, and the conditions annexed to said estimate, if any, shall have been satisfied.

570. All contracts entered into by the said commissioner of public works on account of the water or sewerage works of the city, shall specify that they are for such works.

571. All contracts in which the contractor or contractors agree to be paid from special assessments, shall contain covenants in substance to the effect that such contractor or contractors

Digitized by Google

shall have no claim or lien upon the city in any event, except from the collection of the special assessments made for the work contracted for; and that no liability of any kind shall attach to the city by reason of the entering into such contract, except for the payment over to such contractor or contractors of moneys received by the city under special assessments levied or to be levied for the improvement specified in such contract, and no contract for work to be paid for by a special assessment shall be let except to a contractor or contractors who will so agree.

572. In case the prosecution of any public work shall be suspended in consequence of the default of any contractor or contractors, or in case the bids for doing such work shall be deemed excessive, or the person or persons making proposals are not, in the opinion of said commissioner, responsible or fit to be entrusted with its performance, the said commissioner of public works may, with the approval of the city council, where the urgency of the case and the interests of the city require, employ workmen to perform or complete any improvement ordered by the city council: *Provided*, that the cost and expense thereof shall in no case exceed the amount assessed or the sum appropriated for completing the same.

573. Whenever said commissioner or any other city officer shall let any work or improvement which shall require the digging up, use or occupancy of any street, alley, highway or public grounds of said city, there shall be inserted in the contract for the same, substantial covenants requiring such contractor, during the night time, to put up and maintain such barriers and lights as will effectually prevent the happening of any accident in consequence of such digging up, use or occupancy of any street, alley, highway or public grounds, for which the city might be liable, and also such other covenants and conditions as experience may prove necessary to save the city harmless from damages. And also to provide in such contract, that the party contracting with the city shall be liable for all damages occasioned

Digitized by Google

by the digging up, use or occupancy of such street, alley, highway or public grounds, or which may result therefrom, or which may result from the carelessness of such contractor, his agents, employes or workmen.

574. Whenever any work or improvement is let by contract, to any person or persons, firm or corporation, the officers of the city letting the same shall, in all cases, take a bond from such person, persons, firm or corporation, with good and sufficient sureties, in such amount as shall not only be adequate to insure the performance of the work in the time and manner required in such contract, but also to save and indemnify and keep harmless the said city against all liabilities, judgments, costs and expenses which may in any wise accrue against said city in consequence of the granting of such contract, or which may in any wise result from the carelessness or neglect of such person, persons, firm or corporation, or his, their or its agents, employes or workmen, in any respect whatever; and conditioned also, that when any judgment is recovered against said city by reason of the carelessness or negligence of such person, persons, firm or corporation so contracting, or his, their or its employes or workmen, and when due notice has been given of the pendency of such suit, such judgment shall be conclusive against such person, persons, firm or corporation, and his, their or its sureties on such bond, not only as to the amount of damages, but as to their liability: and conditioned also for the payment of all claims and demands whatsoever which may accrue to each and every person who shall be employed by such contractor, or any assignee or sub-contractor of such contractor, in or about the performance of such contract.

575. It shall be the duty of the commissioner of public works, in letting any contract for any sewer, public improvement or other work, to insert in the contract therefor, a condition to the effect that it shall and may be lawful for said commissioner, whenever he shall have reason to believe that the contractor has

Digitized by Google

neglected or failed to pay any sub-contractor, workman or employe for work performed on or about any public improvement, sewer or other work contracted for, to order and direct that no further vouchers or estimates be issued, and no further payments be made upon such contract until such commissoner shall be satisfied that such sub-contractors, workmen and employes have been fully paid. Every such contract shall also provide, that a certain percentage (not less than fifteen per cent.) shall be reserved out of the moneys earned upon such contract, and that such percentage shall not be payable until such contractor shall satisfy such commissioner or officer letting such contract that all sub-contractors, workmen and employes have been fully paid.

576. Whenever the commissioner shall notify the contractor by notice personally served, or by leaving a copy thereof at the contractor's last place of abode, that no further vouchers or estimates will be issued, or payments made on the contract until the sub-contractors, workmen and employes have been paid, and the contractor shall neglect or refuse, for the space of ten days after such notice shall have been served, to pay such sub-contractors, workmen or employes, it shall and may be lawful for the city to apply any money due, or that may become due under the contract, to the payment of such sub-contractors, workmen and employes without other or further notice to said contractor; but the failure of the city to retain and apply any of such moneys, or of the commissioner to order or direct that no vouchers or estimates shall issue, or further payments be made, shall not, nor shall the paying over of such reserved percentage, without such sub-contractor, workman, or employe being first paid, in any way affect the liability of the contractor or of his sureties to the city, or to any such sub-contractor, workman or employe upon any bond given in connection with such contract.

577. All sewers and drains in any of the streets, alleys, avenues, or public places in the city shall be under the charge of the

Digitized by Google

department of public works, which shall keep the same in good order and condition, and clean and free from obstructions, and shall cause to be made such repairs thereof and of the receiving-basins, culverts, and openings connected therewith, as may from time to time become necessary.

578. The commissioner of public works shall prescribe the mode of piercing or opening any of the sewers or drains, and the form, size, and material of the connections made therewith, and shall have authority to grant permission to make lateral connections with said sewers.

579. No connection shall be made with any sewer or drain without the written permission of the commissioner of public works; nor shall any person drain from any point within the limits of the city of Chicago, into the Chicago river or any of its branches, or into any slip connecting therewith, or into any canal or canals constructed under the authority of said city, without first obtaining a permit for such drainage from said commissioner of public works; and said commissioner is hereby authorized to grant such permits, and to exact a license fee therefor, to be fixed by said commissioner, which said license fee shall be equal to an amount sufficient to defray the expense imposed upon the city, in consequence of granting such permission. And any person making any connection or opening into any sewer or drain, or draining from any point within the city limits into the Chicago river or its branches, or into any canal or canals as aforesaid, without such permission, or in a manner different from the mode prescribed by said commissioner, shall subject the person making the same and the person directing it, respectively, to a penalty of fifty dollars, and twenty-five dollars for each and every day the same is continued.

580. The commissioner of public works may grant permission to persons to construct, at their own expense, sewers or drains, to lay pipes to connect with any sewers or drains built in

Digitized by Google

any of the streets, alleys or avenues in the city, charging a license fee therefor, of five dollars in each case; but such permission shall not be granted except upon the agreement, in writing, of the persons applying therefor, that said work shall be performed by some person or persons duly licensed therefor, and that they shall comply with the ordinances in relation to excavating the streets; that they will indemnify the corporation for any damages or costs to which it may be put by reason of injuries resulting from neglect or carelessness in performing the work so permitted; and that no claim will be made by them or their successors in interest against the corporation, if the work so permitted to be taken up by the authority of the city council, or for exemption from an assessment lawfully imposed for constructing sewers or drains in the vicinity of their property; and upon the further condition that the city council may at any time revoke and annul such permission, and direct such sewers, drains, or pipes to be taken up or removed.

581. No permit shall be granted to any person or persons, corporation or corporations, to open a paved or improved street or alley, unless the party applying therefor shall have first deposited with said commissioner a sum of money sufficient to cover the expense of replacing the same in as good condition as before opening. Said opening shall in every case be replaced by the city, and the actual cost thereof shall be borne and paid by the person or persons, corporation or corporations, for whom such opening was made.

582. The commissioner of public works shall keep a record of all permits granted for connections with sewers or drains, in which he shall enter the names of all persons from whom he may receive money for such permits, with the amount received from each person, and the time when it was received.

583. When the expense of any work or public improvement shall exceed the sum of five hundred dollars, and the same is to be paid out of the general fund, or the water or sewerage fund of

Digitized by Google

said city, the doing of said work shall be let by contract, in the same manner as is provided in cases where the expense of the same is to be paid for by special assessment.

584. In all cases, before the letting of any contract, where bonds are required to be taken by the commissioner of public works, the sureties therein shall deposit with said commissioner a statement, under oath, showing the real property owned by each surety, the location of the same, its value, and the amount of incumbrance or incumbrances, if any, thereon.

585. All moneys to be paid to any person or persons out of the water or sewerage funds, or any special assessment fund shall be certified by the commissioner of said department, or, in his absence from the city, or incapacity by sickness, to act, by the mayor of the city, to the city comptroller, and a warrant therefor shall be drawn, stating therein the particular fund to which the same is chargeable.

586. Neither the commissioner of said department, nor any superintendent, officer, clerk, or other person employed in said department, shall be interested, directly or indirectly, in any contract made or entered into by said department for any work or for any material to be furnished, and all contracts made by said department in which the said commissioner, or any officer or employe of said department, shall be so interested, shall, at the option of the city, be declared utterly void, and of no binding effect whatever, and any officer of said department interested in any contract shall thereby forfeit his office, and be removed therefrom on proof of such delinquency, and it is hereby made the duty of said commissioner, and of the mayor, and of every city officer, to report to the city council any such delinquency when discovered.

587. No officer or employe of said department shall, either directly or indirectly, receive any interest or profit whatever, on

Digitized by Google

account of the deposit of the city funds, nor shall any such officer or employe, either directly or indirectly, make use of or borrow any of said funds for his own private benefit or advantage.

588. Said commissioner shall, on or before the first day of May in each year, prepare and present to the city council a report showing the receipts and expenditures and entire work of his department during the previous fiscal year.

589. The commissioner of public works shall, within thirty days after the commencement of each fiscal year, submit to the comptroller, to be by him laid before the city council with his annual estimates, a statement, as near as the same can be estimated, of the repairs and improvements to be paid for out of the general fund of the city, and necessary to be undertaken by said city during the current year, and of the sums required by said department to make such repairs and improvements, as near as can be estimated; and also, a statement as to any desired improvements, with the probable expense thereof; and of all contracts made and unfinished; and the amount of any and all unexpended balances of appropriations of the preceding and prior years. Said report shall be in detail. The city council, having revised, changed or altered the estimates so submitted, may provide for raising the same, in the annual appropriation bill or ordinance.

590. It shall be the duty of said commissioner to cause to be kept books of account, in such manner as to show with entire accuracy, the receipts and expenditures of said department, and in such manner that the same may be readily understood and investigated; and also to preserve on file in said department duplicate vouchers of all the expenditures of said department, which books and vouchers and all papers and files of said department shall be at all times open to the examination of the comptroller, the finance committee, or any member of the city council.

Digitized by Google

591. The commissioner of public works shall in all matters whereby, by reason of any ordinance, resolution, agreement, or act, heretofore passed, entered into or done, the action of a board of public works is necessary, constitute a board of public works for such purpose, and shall do and perform all things required to be done by or imposed upon said board.

592. In all cases where provision is made by ordinance that the consent of the commissioner of public works shall be obtained to authorize any act to be done, he may grant a permit therefor, subject to the restrictions of the ordinances in relation thereto.

593. The commissioner of public works may direct the removal of any article or thing whatsoever, which may encumber or obstruct any street, avenue, or alley in the city of Chicago, under the penalties prescribed by law.

594. The commissioner of public works shall, when required by the city council, inquire into and report upon any of the matters within the cognizance of the department of public works, and shall, from time to time, communicate to the city council any information or suggestion which he may deem important in relation thereto.

595. All subordinate officers, assistants, clerks and employes employed in said department shall be subject to such rules and regulations as shall be prescribed from time to time by said commissioner.

ARTICLE II.

THE COMMISSIONER'S SECRETARY.

596. There shall be in the office of the department of public works a person to be denominated secretary to the commissioner of public works, whose duty it shall be to preserve and

Digitized by Google

keep all books and papers belonging to said department, or which are required by law to be filed therein.

597. He shall deliver to the city council and to the respective departments, all communications from the said commissioner in writing, and shall attend in the office of said department during the usual office hours, and do and perform such other services as may be required by said commissioner.

ARTICLE III.

THE CITY ENGINEER.

598. The city engineer shall perform such duties as may be required of him by the commissioner of public works, or the ordinances of the city.

599. He shall perform all such services in the prosecution of public improvements, as may require the skill and experience of a civil engineer.

600. He shall have charge of the construction and repairing of all bridges, viaducts and water works, and shall superintend the laying of all main and supply water pipes.

ARTICLE IV.

THE SUPERINTENDENT OF STREETS.

601. The superintendent of streets shall perform such duties as may be required of him by the commissioner of public works, or the ordinances of the city.

602. He shall have charge of the improvement, repair and cleaning of all streets, avenues, alleys and highways in the city of Chicago, and the construction and repair of all sidewalks.

Digitized by Google

ARTICLE V.

THE SUPERINTENDENT OF WATER.

603. The superintendent of water shall perform such duties as may be required of him by the commissioner of public works, or the ordinances of the city.

604. He shall have special charge of the assessment and collection of all water rates or assessments.

605. Said superintendent shall report to the city treasurer, once in each day, all moneys received by him in said department of public works, and at the same time pay over to the said city treasurer all such moneys, with a statement of the same: to what account the same belongs,—and shall take a receipt and duplicate receipt for all moneys so paid over, which said duplicate receipt he shall deposit forthwith with the said commissioner of public works.

ARTICLE VI.

THE SUPERINTENDENT OF SEWERAGE.

606. The superintendent of sewerage shall perform such duties as may be required of him by said commissioner of public works, or the ordinances of the city.

607. He shall have special charge of the construction of all public and private sewers and catch-basins, and the issuing of all permits and licenses in connection therewith.

ARTICLE VII.

THE SUPERINTENDENT OF SPECIAL ASSESSMENTS.

608. The superintendent of special assessments shall be *ex officio* examiner of subdivisions, and it shall be his duty to examine all plats and maps of subdivisions of land in the city of Chicago, upon presentation of the same to him, and if he shall

Digitized by Google

approve of the same he shall so certify. He shall also perform such duties as may be required of him by said commissioner of public works or the ordinances of the city.

609. He shall have special charge of all proceedings connected with the making of special assessments, subject to the directions of the corporation counsel.

ARTICLE VIII.

THE SUPERINTENDENT OF MAPS.

610. The superintendent of maps shall perform such duties as may be required of him by said commissioner of public works, or the ordinances of the city.

611. He shall have special charge of all matters pertaining to the keeping of the records of maps, plats, &c., recorded in the city of Chicago; and of all matters pertaining to street numbers; and he shall make all maps and drawings which may be required by said department.

Digitized by Google

COMMISSIONER'S REPORT.

OFFICE OF THE COMMISSIONER OF PUBLIC WORKS, CITY HALL.

To the Honorable, the Mayor and City Council of the City of Chicago.

GENTLEMEN:—In submitting to your Honorable Body, the Thirteenth Annual Report of the Department of Public Works, for the year ending December 31, 1888, I take pleasure in referring you to the statements of the various heads of Bureaus, which will furnish you information in detail, as to the quantity, class and cost of improvements done under their supervision.

The improvements undertaken and completed are largely in excess of any previous year, and have taxed the ability and energy of the Department to the fullest extent in their successful completion. The increased number of miles of streets improved, the water mains laid and sewers constructed, with a greater number of bridges and viaducts erected than for several previous years, combined with other minor

Digitized by Google

improvements, proportionately increased, indicate an extraordinarily active year for the Department. And further, the successful completion of these extensive undertakings with a limited appropriation, requiring the adoption and enforcement of rigid economy in the employment of labor and the purchase of material, with the advantage of sharp competition in letting of contracts, has resulted in giving to the city a class of public improvements superior in quality at a minimum cost, which, I trust, will be satisfactory to your Honorable Body.

EXTENSION OF WATER SYSTEM.

44.52 miles of water pipe, from four to thirty-six inches in diameter, were laid during the year, making a total of 677.08 miles now laid in the city.

385 new water valves were added: total in place 5,099

519 new fire hydrants were added: total in place..... 6,367

2 fire cisterns were constructed, making a total of..... 53

10,089 new house service taps were added, making a total of..... 125,667

10,089 new house service pipes were added, making a total of.. 125,667

The number of service taps inserted in water mains, including re-taps, is..... 11,564

Digitized by Google

EXTENSION OF SEWERAGE SYSTEM.

There were constructed during the year 19.86 miles of brick and pipe sewers, from twelve inches to 7½ feet in diameter, making a total of..... 492.38 miles.

816 new catch-basins were added, making a total of..... 16,050

674 man-hole chambers were added, making a total of..... 17,577

Old catch-basins were raised to grade, numbering..... 2,231

Old man-hole chambers raised to grade, numbering..... 2,250

Old catch-basins and man-holes repaired, numbering..... 43

Number of catch-basins cleaned..... 10,929

Sewers cleaned to the extent of..... 249½ miles.

House drains laid, amounting to..... 30 miles.

STREET IMPROVEMENTS.

There were 1,049,201.55 square yards, or 54.33 miles of streets paved during the past year.

There were 97,285 square yards of street pavement repaired, and 2.67 miles of street planked.

There were 95,430 square yards of pavement laid by the various street railway companies in streets occupied by their tracks.

Digitized by Google

Total streets paved in the city	348.53 miles.
New sidewalks constructed	37.13 miles.
Sidewalks reconstructed	147.23 miles.
Sidewalks repaired	123.73 miles.
Total sidewalks in city	1,161.11 miles.
Streets cleaned	5,739.10 miles.
Number of aprons, culverts, crossings, etc., built	9,510
Number of street lamps erected, (gas)	2,076
Number of street lamps erected, (oil)	2,184
Total number of street lamps in the city	25,078
Street lamps repaired	62,207
Number of buildings removed	1,313

MAPS AND PLATS MADE.

For new subdivisions	245
For opening, widening and vacating streets and alleys	528
For sidewalks	339
For lamp posts	1,368
For law department	145
For miscellaneous purposes	174
For city map	1
Total	2,800

Digitized by Google

TOTAL ASSESSMENTS PREPARED.

For improvement of streets and alleys	249
For private drains	104
For water service pipes	134
For street and alley openings	6
For new sidewalks	439
For gas lamps	134
For Dyatt champion lamps	2
For oil lamps	33
Total	1,101

MISCELLANEOUS.

SPECIAL IMPROVEMENTS.

Constructing House of Correction with residence for the Superintendent.

Police station building, No. 480 North avenue.

Police station building, corner of Morgan and Maxwell streets.

Police station building, Nos. 526 and 528 Warren avenue.

Police station building, No. 2913 Deering street.

Engine-house for Fire Department, No. 1494 West Lake street.

Repair Shop for Fire Department, No. 173 and 177 Sebor street.

Digitized by Google

Dredging Chicago River and branches.

Pumping machinery for new works.

Sweeping and cleaning improved streets.

Constructing viaduct over railroad tracks at Western avenue.

Constructing viaduct over railroad tracks at Thirty-fifth street.

Constructing viaduct over railroad tracks at Ashland avenue.

Constructing viaduct over railroad tracks at Twelfth street.

Constructing viaduct over railroad tracks at Dearborn avenue.

Constructing bridge over Chicago River at Deering street.

Central pumping station building, Harrison street.

South pumping station building at Fourteenth street and Indiana avenue.

Completing protection around crib at old water tunnel.

Constructing approach and viaduct, Fifth avenue to Twelfth street.

Constructing approach and viaduct, Polk street to Fifth avenue.

New four-mile lake tunnel for new pumping works.

Constructing new crib at end of new tunnel.

Digitized by Google

CONTRACTS.

Contracts were entered into by the city, for public improvements and various classes of material under the immediate supervision of this Department, incurring an expenditure of $4,028,621.90 as follows:

199	contracts for street and alley improvements, at a cost of	$1,630,964 78
23	contracts for curbing, filling and grading streets, aggregating	107,204 04
118	contracts for water-service pipes, costing	89,934 96
100	contracts for private house drains, costing	65,979 92
17	contracts for constructing sewers, aggregating	175,957 82
7	contracts for erecting police stations, costing	45,886 00
2	contracts for constructing fire engine houses, costing	22,494 00
3	contracts for building House of Correction, aggregating	28,872 00
1	contract for finishing sewer pipe, aggregating	3,498 57
2	contracts for furnishing pine lumber, aggregating	5,850 59
3	contracts for furnishing oak lumber, aggregating	9,623 23

Digitized by Google

4	contracts for castings for water pipes, aggregating	$ 32,000 00
2	contracts for furnishing cast iron water pipe, aggregating	170,011 00
1	contract for castings for sewer work, aggregating	16,636 00
1	contract for furnishing brass castings for water department, aggregating	4,905 00
1	contract for furniture for Council chamber	798 00
1	contract for furnishing lamp posts.	3,123 00
1	contract for glass for street lamps.	4,890 72
9	contracts for completing rotunda..	20,400 00
1	contract for completing Library rooms	2,610 00
1	contract for sweeping and cleaning streets	88,168 41
1	contract for dredging Chicago River and branches	41,588 90
1	contract for pumping machinery for new works	369,785 00
12	contracts for constructing viaducts, aggregating	612,901 91
10	contracts for erecting Central pumping station building	111,018 19
12	contracts for coal for pumping stations, City Hall, bridges, shops etc.	274,549 00

Digitized by Google

3	contracts for pig lead for laying water mains	$33,160 00
1	contract for sub-structure and approaches to Deering street bridge.	9,964 42
3	contracts for teaming for water and sewerage departments	26,697 95
1	contract for steam tug service to Lake crib	1,750 00
1	contract for paving-cement for street work	17,398 49
	Total	$4,028,621 90

FINANCIAL.

Statement of the sum appropriated by the City Council, together with various amounts from other sources, to be expended in public improvements under the supervision of the Department, for the year 1888:

Balance Jan. 1, 1887, to credit of water, sewerage, general appropriation and City Hall funds	$1,449,235 33
From appropriations for 1888	1,782,495 65
From rent of Rookery lot	35,000 03
From interest on water fund investment	24,371 20
From premium on water loan bonds	5,383 00

Digitized by Google

From street lamps, special assessments and other funds	$ 183,153 01
From private parties, money advanced	25,867 00
From water revenue, including tapping permits	1,595,528 08
From drain permits and drain layers' licenses	42,097 50
From railroad companies, on account bridges and viaducts	209,449 52
From house-moving permits	3,676 00
From special deposits for street permits	8,800 00
From labor and for material sold	110,417 35
From vouchers deposited back, and miscellaneous	7,597 74
From special assessments	3,655,956 78
Total	$9,139,028 19

Of this amount, expenditures have been made as follows from general appropriation, sewerage and City Hall funds in 1888:

For bridges and viaducts, dredging, street cleaning, public buildings, tunnels, Canal pumping works, Fullerton avenue pumping works, parks, work for private parties, salaries, City Hall, constructing and maintaining sewers and catch-basins	$2,426,835 50

Digitized by Google

For water supply, pipe extension.....	$403,718 06
For private work by water department...	38,575 38
For extension of North pumping works.....	527 00
For investment in city bonds.....	532,000 00
For new shore inlet...	27,693 49
For interest on water loans.....	262,124 50
For real estate.....	148,221 25
For South Side pumping works.....	14,587 60
For Central pumping works.....	62,684 46
For crib protection....	113,466 35
For new land tunnel..	29,097 46
For new lake tunnel..	197,579 35
For maintenance of water system, operating pumping works, cost of collecting water taxes etc....	591,167 15
For street improvements, street openings, sidewalks, private drains, water service pipes, and lamp posts.....	1,914,605 19

Digitized by Google

For rebate (excess of assessments over cost of improvements), abatements to property owners doing their own work, land damages and assessments held over and annulled by the City Council.....	$1,741,351 59	$8,504,234 33

BALANCE.

December 31, 1888, to credit of water, sewerage, City Hall and general appropriation funds.....	634,793 86
	$9,139,028 19

Digitized by Google

WATER WORKS.

One of the most important subjects demanding our attention and earnest care, is the supplying of our citizens with an abundance of clean, pure water. A marked and decidedly satisfactory improvement has been made in this direction during the past year. Water of good quality and sufficient quantity has invariably been supplied.

The selection by Mayor Roche of Mr. F. W. Gerecke, to take supervision of the water works system of the city, has proved a most judicious one. Competent, industrious, watchful, he has fulfilled expectations, and redeemed the promises made in a preliminary report of February last. I earnestly recommend the perusal of his annual report. It is interesting and instructive, and will give you an idea of what has been accomplished in less than a year.

On September 11 last, the Murphy smokeless furnace was put under two of the boilers at the North Side water works, enabling us to use soft instead of hard coal, thereby effecting a saving of $32.00 to $35.00 per day. Their introduction under all the boilers will effect a saving of about $110 per day in the use of bituminous in place of anthracite coal.

At these works I would recommend that the old machine shops, paint shops and barns be taken down, the basin filled in, and the ground laid out in parks,

Digitized by Google

thus beautifying the works and bringing them into harmony with the surroundings; the costly and beautiful homes of many of our most wealthy citizens being in the vicinity.

As will be seen by the report of Chief Engineer Gerecke, the West Side pumping works at Twenty-Second street and Ashland avenue, have been quite thoroughly overhauled, resulting in making more effective and largely increasing the pumping capacity of that station.

At these works the enormous quantity of over twenty-one billion gallons of water has been pumped during the past year. To be exact, 21,046,189,980 gallons, at a cost of $4.65 per million gallons. The pumpage at the North Side works was 15,503,534,775 gallons, and would have been much larger had the pumps been in good order the full time.

Our pumping capacity, as repaired, refitted and reorganized, is now equal to our present tunnel capacity. The completion of the new inlet, 1,500 feet into the lake, has been accomplished, and in case of emergency can be used to furnish pure water.

The protection to the crib has also been completed during the year, and has been pronounced, after a critical examination, a most excellent work of engineering skill. It was not accomplished any too soon, as the crib had begun to show signs of weakness and decay, the result of combined battles with sea and ice.

Digitized by Google

During the summer months, all restrictions concerning the use of water were removed, and notwithstanding that fact, and the further fact that over *forty-one miles* of additional mains were laid, and over *ten thousand* service taps put in, there was an abundance of water at all times.

In contrast with the previous year, when we were pumping wind instead of water, there was not a solitary complaint of scarcity. On the other hand, numberless words have come from the press and from individuals, commendatory of the improved condition of our water works system and the unlimited quantity of water supplied. With Lake Michigan at our very doors, I see no reason why any man, woman or child in Chicago should be stinted in the slightest degree in the use of water.

I do not wish to be understood as recommending any needless waste of anything even as free as water; but if any operation can be better performed, even in the slightest degree, with the use of a gallon instead of a pint, I consider it our city's duty to furnish the gallon. We have done all that can be done toward putting our people in that condition which we have scriptural authority for believing is next to Godliness.

In connection with this subject, I would recommend the establishment by the city of a number of free bath houses, both floating and permanent, with attendants.

Digitized by Google

It would, I have no doubt, prove beneficial to a large number of people. Our city is behind the times in this respect.

Since our last report, the contractor for the new and extensive lake tunnel has been energetically at work, and at present writing has about finished the land portion of the undertaking, to-wit: from Peck court south to Fourteenth street, the site of the South Side water works, and from Peck court west to Harrison and Desplaines streets, the site of the new West Side station. He has also progressed quite a distance out under the lake. A description of the new works, engines, pumps etc., is given in detail in the report of the City Engineer.

Upon the completion of this vast work, and the adding of the high-pressure system so ably advocated and explained by his Honor, Mayor Roche, Chicago will stand unexcelled in the vastness and completeness of her water works system. The inexhaustibility of the supply, and Chicago's rapidly growing needs, warrant the necessary expenditure.

NORTH PUMPING WORKS.

(FOUR DOUBLE AND TWO SINGLE ENGINES).

The repairs and changes made on the North pumping works machinery have added materially to their usefulness, and they are now in condition to furnish

Digitized by Google

daily to the city their full registered capacity of gallons, giving to the citizens an ample and generous supply of water.

The quantity furnished by these works for the past year was 15,503,534,775 gallons, an average of 42,475,712 gallons per day under a head of 100 feet.

The cost of pumping and other expenses at these works, including coal and stores on hand, general repairs etc., for the past year, was $158,543.46.

WEST PUMPING WORKS.

(FOUR ENGINES.)

The quantity of water pumped at these works during the year was 21,046,189,980 gallons, being an average of about 57,660,794 gallons per day under a head of 100.5 feet.

Expenses due to pumping are.....	$97,989 26
Other expenses at these works....	3,470 39
Total.....	$101,459 65

The quantity of water pumped by these combined works during the year was 36,549,724,755 gallons, being equal to a daily average of about 100,136,506 gallons.

The total average pumping capacity of the engines now in use in the city is 153,000,000 gallons for each

Digitized by Google

twenty-four hours. The greatest quantity of water pumped in any one day during the year occurred June 20th; 120,745,850 gallons.

PIPE SYSTEM.

Water pipes were laid during the year as follows:

Four (4) inch	9,771 feet.
Six (6) inch	124,448 feet.
Eight (8) inch	60,543 feet.
Twelve (12) inch	20,523 feet.
Sixteen (16) inch	17,021 feet.
Twenty-four (24) inch	2,730 feet.
Total	235,036 feet.

The whole being equal to 44.52 miles. Small pipe taken up and abandoned 5.70 miles; net pipe added to the system during the year 38.84 miles—a total of 677.08 miles of pipe laid in the city at the close of the year.

Fire hydrants placed in position during the year	519
Hydrants taken out and replaced by others of different sizes	51
Net number of hydrants added to the system	468
Total number of fire hydrants now in use	6,367
Stop valves put in place during the year	385
Stop valves taken out and replaced by others of different sizes	22
Net number of stop valves added to the system	362
Total number now in use	5,099

Digitized by Google

WATER METERS AND ENGINES.

Number of new meters put in during the year.	213
Number of old meters removed	364
Net decrease	151
Total number of meters now in use	3,122
Number of city meters removed and replaced by new ones	105
Total number of meters repaired	1,470

The revenue derived from water measured by these meters and engines for the past year amounts to $517,517.05, an increase of $18,283.10 over the amount collected from the same source last year.

WATER WORKS RECEIPTS AND EXPENDITURES FOR 1888.

RECEIPTS.

Water rates collected (including delinquents)	$1,557,116	78
Water service cocks (permits and plumbers' licenses)	38,411	30
Water meters, labor etc., for private parties	42,830	03
Rent of Rookery lot	35,000	03
Advances to lay water pipe	16,122	00
Premiums on water loan bonds	5,383	00
Interest from investment	24,371	20
Old material sold	7,593	26
Miscellaneous	1,065	97
Total	$1,727,893	57

Digitized by Google

EXPENDITURES.

For salaries and other expenses, Water collection office	$	125,743 40
For salaries and other expenses paid from water fund		6,753 54
For expenses for Tapping department		39,068 70
For meters, fitting and private work		38,575 38
For interest on water loan bonds		262,124 50

Total cost of water works of the city to December 31, 1888, is as follows:

Cost up to May 6, 1861, when the works were transferred from the Board of Water Commissioners to the Board of Public Works.....	$1,020,160 21

EXPENDITURES SINCE 1861.

Cost of water pipe laid (including labor).....	$7,245,048 20
Cost of North pumping works.....	918,573 14
Cost of West pumping works.....	894,565 75
Cost of first lake tunnel.....	464,866 05
Cost of second lake tunnel.....	415,709 36
Cost of lake crib protection.....	113,466 35
Cost of new lake tunnel.....	202,298 01
Cost of land tunnel.....	542,912 63
Cost of new land tunnel.....	29,788 32
Cost of lake tunnel crib.....	70,319 10
Cost of lake shore inlet.....	42,871 17
Cost of new lake shore inlet.....	89,474 17
Cost of water works shop.....	25,551 73
Cost of water works stock.....	29,318 00
Cost of water reservoir fence.....	1,702 87
Cost of addition to stable	1,019 48
Cost of real estate for sites of new pumping works.....	205,472 35

Under the various orders and ordinances of the City Council, amounts have been rebated on water rates during the year, as follows:

On educational, religious and charitable institutions, under ordinance of November 21, 1884	$12,350 64
Municipal and Board of Education, under ordinance of July 30, 1885	19,951 10
On private residences by various orders passed by the City Council	147 50
Total amount rebated	$32,449 24

SEWERS.

The sewerage system has been extended in the various divisions of the city during the past year as follows:

Constructed in the West Division	15.146 miles
Constructed in the South Division	2.832 miles
Constructed in the North Division	1.888 miles
Total	19.866 miles

Number of catch-basins built	816
Number of man-hole chambers built	674

The cost of constructing sewers and catch-basins during the year was as follows:

West Division	$181,246 62
South Division	29,839 93
North Division	17,481 02
Total	$228,567 57

Digitized by Google

Total number of miles of sewers in the city December 31, 1888	492.37
Total number of catch-basins	16,050
Total number of man-hole chambers	17,577

MAINTENANCE.

The cost of cleaning and repairing sewers, the cost per mile, and number of miles; also the number of catch-basins and man-hole chambers distributed in the three divisions of the city, is as follows:

DIVISIONS.	MILES OF SEWERS.	NUMBER OF CATCH-BASINS.	NUMBER OF MAN-HOLE CHAMBERS.
West	278.63	8,837	9,862
South	132.47	4,506	4,782
North	81.27	2,707	2,933
Totals	492.37	16,050	17,577

The cost of repairing sewers during the year was $8,722.38, being an average cost of $17.71 per mile.

The cost of cleaning was $52,422.41, making the average cost $106.47 per mile.

The total cost of both repairs and cleaning was $61,144.79, an average cost of $124.18 per mile.

Of the 492.37 miles of sewers constructed, 248,033 miles are of brick, and 244,337 miles of vitrified pipe.

RIVER IMPROVEMENT BONDS.

Bonds outstanding December 31, 1888, bearing 7 per cent. interest and maturing as follows:

July 1, 1890	$250,000 00	
July 1, 1892	249,000 00	
July 1, 1893	500,000 00	
July 1, 1894	346,000 00	
July 1, 1895	1,263,000 00	
Total River Improvement debt		$2,608,000 00
Grand total outstanding		$5,230,500 00
Total interest paid on sewerage bonds to January 1, 1889		$4,731,261 00
Total amount paid as interest on river improvement bonds to January 1, 1889		$3,762,180 00
The whole amount paid as interest on water, sewerage and river improvement bonds combined		$14,948,135 75

THE RIVER.

Concerning my observations of last year, I am still of the opinion that the Chicago River does not receive at the hands of your Honorable Body the attention its importance demands. Systematic and continued dredging should be provided for and insisted upon.

Digitized by Google

During the year the plan of requiring all dredging to be done under permit, issued by this Department, was introduced and successfully carried out. It had been the custom, heretofore, to dredge indiscriminately, without the knowledge of the city authorities, as to when and where. In many cases the dredgings were taken from one place only to be dropped in and along the river, at other places. Under the plan adopted, before any dredging can be done, it is required that a permit shall be taken out, stating when and for whom said work is to be done. The city then details in each case an inspector at the expense of the party doing the work. It is the inspector's duty to see that the dredgings are not again dropped into the river, but carried out and into the lake. The results have proved quite satisfactory.

Would it not be well to see if a proper dredging of the river could be provided for by special assessments on dock property?

The importance of the river to the City of Chicago and her interests, suggests your being liberal in your views looking toward its improvement.

RIVER LIGHTING.

A season's test of the lighting of the river by electricity has abundantly proved the wisdom of the initial step. The plant should be enlarged and the circuits

Digitized by Google

extended, making it more pleasant and as easy to navigate the river at night as by daylight, and lessening the annoyance of bridge detention during business hours.

STREET LIGHTING.

The city is lighted by gas lamps, gasoline lamps and by electric arc-lights. The several gas companies have not kept pace with the growth of the city in laying mains, and consequently the erection of gasoline lamps has been large in the districts not yet occupied by gas companies. The expense is great, and it would be economy on the part of the city to do this work itself, rather than by contract, as at present. I am of the opinion that from $15,000 to $20,000 per annum can be saved, if the city will take hold of this matter.

The lighting by electricity, recently introduced, has proved a decided success, and marks a new era in street lighting. Demands are being made from all parts of the city for its introduction and use. In its further extension I would recommend the placing of a light at the entrance to each alley, and midway in the alley where the blocks are over three hundred feet in length.

For the full details of the cost etc., I refer to the report of Prof. Barrett.

Digitized by Google

BRIDGES AND VIADUCTS.

The expense for the maintenance of bridges and viaducts for the past year has been quite large, owing to the fact that in previous years but little had been done in this respect, even the ordinary wear and tear repairs having been neglected. It was necessary for public safety to at once put all of these in proper condition.

The cost of maintaining these structures for the year was as follows:

For general repairs of bridges and viaducts	$115,706 90
Of this amount there was received for labor and material, and from vessels for damages to bridges	1,783 03
Total cost to city for repairs of bridges and viaducts	$113,923 87

The past year has been unparalleled in the history of the city in the building of new viaducts and bridges. It has been the policy of his Honor, Mayor Roche, to provide for the accommodation of the people adequate and much needed facilities in this direction. Early in the year he formulated plans for viaducts to be provided for at the expense of the various railroad companies of the city. By judicious management he

Digitized by Google

secured the willing co-operation of the corporations, resulting in the erection of such works at a cost to the several railroads interested, of nearly *one million dollars*. This work is to be continued during 1889, plans having been already formulated looking toward the erection of about ten such structures. The Mayor has arranged with the roads over whose tracks the work is to be done for an early conference to settle details.

For cost and description of work done you are referred to the report of the City Engineer.

NORTH BRANCH RIVER PUMPING WORKS.

The past year 5,606,704,120 cubic feet of water were forced from the lake into the river at the Fullerton avenue works, at a cost for operating and maintenance of $20,946.34; $3,250.00 being chargeable to 1887, for fuel oil.

SOUTH BRANCH RIVER PUMPING WORKS.

These works have been in constant use during the year, excepting the time required in making some trifling repairs, or on account of excessive high water in the river. The total cost of operating and maintaining them was $39,618.91.

Digitized by Google

OGDEN DAM.

The dam constructed in 1886 remains in good condition at this point, but in May last a channel was cut through the bank at a point south of this structure. A temporary dam was immediately built, and later in the season a permanent one was substituted, which will no doubt afford ample protection.

The amount expended for maintenance during the year was $579.19.

PARKS.

The strictly city parks are few in number and area, yet are of sufficient importance to demand your thoughtful attention and liberal consideration. Lake Front park could, by a fair allowance of money, properly expended, be made to minister to the health and social enjoyment of thousands of our citizens who seldom have the leisure to visit our grand outlying park system.

SEWERAGE.

The question of sewerage is a most important one. It is demanding public attention to such a degree as warrants the belief that within a short time a plan or plans will be evolved and put into execution, which

Digitized by Google

will relieve the anxiety forced upon us by the continued growth of population. This growth and the increase of wealth will justify the large expense necessary.

STREETS.

The Department having in charge the improvement and maintenance of our streets meets with constant criticism, much of which is not merited. Subject to annoyances and obstacles that seem insurmountable, it is impossible to accomplish satisfactorily all that is desired in the work.

The constant tearing up of street pavements and their improper and hasty re-laying, render it impossible to keep them in a good condition. Subject to the needs or wants of gas, telephone, electric and subway corporations and private citizens, it is one continual round of tearing up and repaving, and yet unavoidable. It is to be hoped that at no distant day this costly and disagreeable annoyance will be avoided by the construction of extensive underground conduits by the city. In these conduits can be placed wires, pipes, etc. I hope this may come about by utilizing the space under the sidewalks.

During the past year attempted combinations for advanced prices have been foiled, and competition has

Digitized by Google

been spirited, resulting in the letting of contracts at low prices. The supervision of the work has been vigilant and competent.

As to the kind of pavement laid, cedar block largely predominates. For the central portion of the city, granite has been adopted, but numerous complaints have been made by occupants and owners of business blocks, regarding the noise that accompanies its use. As to its durability, there is no question, but when the wear and tear upon vehicles and horseflesh, and the attendant noise are considered, its economy is questioned. A selected cedar block, laid upon a concrete or crushed stone foundation, is perhaps the best pavement offered to the public, being durable, noiseless and economical.

In the matter of street cleaning, the Department meets with many and varied obstacles. The citizens are unmindful of their duty; stores are swept out at all hours of the day; the streets are made a common dumping ground for refuse material of all kinds, and proper receptacles for garbage and ashes are not provided by law. Very often after a thorough cleaning, dirt, dust, ashes and materials are carted through the city in wagons not properly constructed for such use, resulting in droppings being scattered on and along the newly cleaned pavement.

Notwithstanding these drawbacks, the officials in charge of this service, by diligence and intelligent

Digitized by Google

supervision, have, in the judgment of those citizens who are capable of forming an estimate of the work to be done, kept our thoroughfares in a satisfactory condition.

The appropriations for this work should be largely increased, enabling us to extend our system of cleaning to the newly paved streets.

STREETS.

During the year streets were improved as follows :

Paved with cedar blocks	47.15	miles.
Paved with macadam	3.67	miles.
Paved with granite block	3.04	miles.
Total number of miles improved	53.86	miles.
In addition to the above, streets were planked for a distance of	.47	miles.
Making a total of	54.33	miles.

	133.63	12.94	0.66	147.23	123.73	270.96

There were constructed 37.13 miles of sidewalk upon streets where walks had never been previously laid. About 19.64 miles of the same, varying in width from four to six feet, were built by the Department, and the remainder by contractors under special agreements with property owners.

The total number of miles of sidewalk laid in the city, including those constructed on highways controlled by the Park Commissioners, is as follows:

	MATERIAL.			Total Miles.
	Wood.	Stone.	Concrete.	
City.....	1,028.72	99.55	16.34	1,144.61

STREET CLEANING.

The past year, 3,051.34 miles of improved streets were swept and cleaned, under a contract between the city and Jno. S. Cooper, for the sum of $23.99 per mile, the total cost being $73,201.64. The work was commenced on April 2, and discontinued on November 27, 1888. Of improved streets, 2,138.11 miles were swept, under contract, by Jno. S. Cooper, at $7.00 per mile, the total cost being $14,966.77. Work was commenced on April 2, and discontinued on December 31, 1888. Total amount expended under contracts, $88,168.41.

1888.....	4,958	116,419	22.0	20,360,800 00
Totals for 6 yrs.	27,348	637,447	120.4	$119,277,000 00

There were moved under the supervision of the Department of Public Works, 1,207 frame and ninety-nine brick buildings, a total of 1,306. They varied from one to three stories high, and extended over a surface of 26,131 lineal feet, or nearly five miles of frontage.

PAY DEPARTMENT.

Soon after the induction into office of the present administration, a radical change in the manner of paying employes of the Department was adopted. The old system was annoying and wasteful of time and patience, as every employe had to visit the City Hall to draw his pay, the practice being to have different departments paid on succeeding days. Lines of men would form from the paying window of the City

DEPARTMENT OF PUBLIC WORKS.

PAY WAGON.

Digitized by Google

Digitized by Google

Treasurer's office, out into and along the corridor, interrupting free access to adjacent rooms and demoralizing the office forces. It was found that the custom cost the city, annually, in time lost and paid for, nearly $30,000. This fact led to the adoption of the present system.

A Pay Wagon was built by the Department—a strong, well arranged vehicle. By following the course of the wagon on one of its trips an insight into the workings of the system can be had. On pay-day, twenty or more stops may have to be made. A schedule of these stops is carefully drawn up the day previous. The pay roll is made out, containing the name of every employe, his number and the amount of his pay, his number being written on the envelope containing the money, and cards with corresponding numbers being given the foreman for proper disposition among the men. The envelopes are sealed and placed in drawers in a combination lock safe. There is one drawer for each gang of men and but one drawer at a time is taken from the safe.

At 6 A. M. in the morning of pay day, the wagon is brought to the City Hall by a Police department team, in charge of a trusty driver. The safe containing the funds is placed under the supervision of Assistant City Treasurer Mamer and Paymaster John Freeman, and is escorted by two policemen. The schedule is so carefully prepared that each foreman

Digitized by Google

knows almost to the minute when the wagon will arrive and his men are all in line, tickets in hand. It takes but a short time to receive the tickets, pass out the corresponding envelopes and start for the next stopping place, and so on till all are paid.

To pay firemen, policemen and laborers now takes three half days. The men do not have to stand in line for hours, the public are not annoyed by the crowds in waiting and the city saves over $29,000 per year.

CONCLUSION.

In submitting this, my Second Annual Report, I earnestly request that you carefully read the detailed reports which follow, and thus gain much information regarding the marvelous growth and improvement of the city during the past year.

Respectfully yours,

GEO. B. SWIFT,

Commissioner.

REPORT

OF THE

Bureau of Engineering

CITY OF CHICAGO.

Digitized by Google

Digitized by Google

ENGINEER'S REPORT.

CHICAGO, January 25, 1889.

HON. GEO. B. SWIFT,

Commissioner of Public Works.

DEAR SIR:—I submit herewith a report of the operations of the Bureau of Engineering for the year 1888, being the Thirteenth Annual Report under the Department of Public Works.

WATER PIPE EXTENSION.

The amount of water pipe laid during the year 1888 is nearly the same as last; a fraction over 44.5 miles.

The net increase to the system is somewhat smaller, more of the old three and four inch pipe having been replaced than in 1887, the total for the year being 29,950 feet.

The demand for pipe on streets where sufficient revenue would be derived to warrant us in laying it has been so great, that we have been compelled to refuse to lay a great amount in front of vacant real

Digitized by Google

estate at the expense of the property owners. The amount laid at their expense during the year, the cost of which will be refunded when sufficient revenue is derived therefrom, is 11,043 feet.

The total amount of pipe of all sizes in use by the city on December 31, 1888, was $677\frac{404}{5280}$ miles.

We have in service in connection with the system 5,099 stop valves, 6,367 fire hydrants and eighty-three fire cisterns.

Water mains have been lowered in the following streets:

Lake, from Western avenue to Seymour.

Burling, from Webster avenue to Belden avenue.

Halsted, from Belden avenue to Fullerton avenue.

Ohio, from Wood to Robey.

Samuel, from Chicago avenue to Clarinda.

Bickerdike, from Indiana to Ohio.

Center, from Halsted to Sedgwick.

Thirty-seventh, from Cottage Grove avenue to Ellis avenue.

RIVER AND DREDGING.

Owing to the extreme low stage of water during the season, it has been difficult to keep the channel deep enough for vessels of deep draught; and although the entire appropriation was expended in dredging the worst places, a great many vessels have grounded in the channel, causing blockades and vexatious delays to the general traffic of the river.

Vessels are being built each year of greater draught than the year preceding, and the entire channel should be deepened at as early a date as possible, or else the larger vessels must seek other ports, leaving the carrying trade of Chicago to those of less draught.

The mean level of the water in the river has been sixty-four one-hundredths (0.64) of a foot lower than for the year 1887, and one and twenty-four one-hundredths (1.24) feet lower than for 1886. It was the lowest stage for at least seven years. Twice during the year the gauge has shown 0.0, or the level of low water in Lake Michigan in 1847, from which our city datum is taken.

The following tables give the height of water in the river and in Lake Michigan, the temperature, and the amount of rainfall for the year 1888:

BRIDGES AND VIADUCTS.

A greater number of these structures have been built during the past year than ever before in one season, and at a less cost to the city.

EIGHTEENTH STREET BRIDGE.

This bridge was completed August 20, but owing to non-completion of the connecting viaduct, was not open to traffic until later.

EIGHTEENTH STREET VIADUCT.

This viaduct should have been completed March 1; was not finished until November 1, and the bridge and viaduct were opened to traffic November 6.

JACKSON STEET BRIDGE AND VIADUCT.

These were both opened to traffic August 25. Plats of the above mentioned bridges and viaducts were given in last year's report with statement of cost etc.

WELLS STREET BRIDGE.

This structure was furnished by the North Chicago Street Railroad Co., under the terms of their franchise giving them the use of La Salle street tunnel. It is in

Digitized by Google

every way a first-class bridge, with double roadway, steam turning machinery etc. Its length is 220 feet on middle truss and its width fifty-eight feet over all.

The substructure was built by the Fitz Simons & Connell Co., and the superstructure by the Keystone Bridge Co., of Pittsburgh.

The cost was as follows :

Substructure	$59,000 00	
Superstructure	86,750 00	
Machinery	4,690 00	
Total		$150,440 00

This bridge was opened for traffic August 24, 1888.

The old structure was moved from its place at Wells street to the substructure prepared for it at Dearborn street. It has been repaired by the city, and is to be furnished with steam turning machinery by the North Chicago Street Railroad Co.

DEERING STREET BRIDGE.

A contract was let to the Chicago Dredging & Dock Co. for the pile substructure and protection of a bridge across the South Branch at Deering street, on October 20, which contract has been completed by them.

A combination bridge with steel chords and wooden braces will be erected there by Messrs. Schailer & Schniglau, to be completed about April 30, 1888. The cost will be about $28,000.00.

Digitized by Google

WESTERN AVENUE VIADUCT.

This viaduct is a double roadway structure, 140 feet span, over the tracks of the Chicago, Milwaukee & St. Paul Ry., the Chicago & North-Western Ry., and the Chicago, St. Louis & Pittsburgh Ry., at Western avenue and Kinzie streets.

The cost, paid entirely by the railroad companies, was as follows :

Substructure	$57,910 89	
Superstructure	17,000 00	
Sundries	5,801 99	
Total		$80,712 88

This amount does not include the cost of engineering, inspection and some other items not included in contracts.

This viaduct will probably be open for traffic early in February.

ASHLAND AVENUE VIADUCT.

This structure is over the tracks of the same railroads as the Western avenue viaduct. It consists of one double roadway truss span of 191½ feet, and four plate-girder spans of 46.25 feet each.

The south approach and the superstructure are chargeable, according to contract, to the railroad companies, and the north approach is to be paid for by the city, subject to a decision of court as to the liability of the railroad companies.

Digitized by Google

This viaduct is now practically completed and ready for traffic.

Contractors: substructure, Wm. F. Hair; superstructure, A. Gottlieb & Co.

The cost to date is as follows:

Substructure	$44,439 07	
Superstructure	44,684 00	
Sundries	5,194 28	
Total	$94,317 35	
City's portion	28,917 99	
Leaving to the railroad companies		$65,399 36

DEARBORN STREET VIADUCT.

Late in the season, arrangements were made to let the work of constructing a viaduct at Dearborn street, whereby the bridge might be rendered available.

The viaduct occupies the west half of Dearborn avenue from Kinzie street to the river, leaving the east half for team traffic to and from the freight-houses and warehouses on the river.

The contractors for the work are: substructure, M. C. & J. Duffy; superstructure, Lassig Bridge & Iron Works.

The cost as per contract is:

Substructure	$13,191 43	
Superstructure	44,957 00	
Sundries to date	4,710 31	
Total		$62,858 74
Toward this the Chicago & North-Western Railway Co., agrees to contribute		40,000 00
Leaving for the city		$22,858 74

The work on this structure is being rapidly pushed by the contractor and it will probably be open for traffic about February 1, 1889.

POLK STREET VIADUCT.

This structure is built entirely at the expense of the Chicago & Great Western Railroad.

The contracts for the work were let directly by the railroad company, according to plans approved by the Department of Public Works. The work was done under the supervision of the Department.

The work comprises an approach from Ellsworth street to the west end of Polk street bridge; the raising of the bridge four feet and building up the centre pier, and putting in new end pieces to bridge, and a retaining wall back of the west pier.

On the east side of the river the viaduct extends to the west line of Fifth avenue, where it meets a very handsome approach, descending northward, and built entirely on land furnished by the railroad company.

The work is about completed and the viaduct will be opened for traffic very soon.

The cost of the work cannot be ascertained at the present time.

The character and extent of the structure will be shown by the accompanying plate.

Digitized by Google

FIFTH AVENUE APPROACH TO TWELFTH STREET VIADUCT.

This structure is a continuation of Fifth avenue from Taylor street to Twelfth street viaduct, adding greatly to the usefulness of that structure.

It consists of an approach of curb wall and filling for 200 feet, the remainder being girder work.

The work was done by the following parties: substructure, Joseph Downey; superstructure, Chicago Forge & Bolt Company.

This approach was completed and opened for traffic December 3, 1888, and immediately became a much used thoroughfare.

The cost has been $60,000.00, paid entirely by the Chicago & Great Western Railroad.

EAST TWELFTH STREET VIADUCT WEST OF CLARK STREET.

The wooden trestle work at the east end of Twelfth street bridge has been removed and an iron superstructure, supported partly on stone piers, and partly by iron columns, has been built in its place by the Chicago, Rock Island & Pacific Railway. For this the

Digitized by Google

city pays the railroad company $20,000.00, and is forever released from all land damages in connection with that portion of the viaduct.

This makes a continuous structure of iron from the east side of Clark street to Twelfth street bridge.

EAST TWELFTH STREET VIADUCT EAST OF CLARK STREET.

Arrangements were completed early in the season and plans decided on, for the extension of Twelfth street viaduct from the east line of Clark street eastward to State street, the Atchison, Topeka & Santa Fe Railroad to pay for the work.

Contracts were let for both substructure and superstructure, and the work on the substructure between Clark street and State street has been completed.

The superstructure is well under way, and will probably be completed in May.

The cost will be about $170,000.00. Contractors for substructure, Sackley & Peterson; contractors for superstructure, Riter & Conly, of Pittsburgh.

THIRTY-FIFTH STREET VIADUCT.

This viaduct, when completed, will span from the east side of Stewart avenue to the west side of the

Digitized by Google

Chicago & Western Indiana tracks, a distance of about 400 feet. The approaches will reach eastward to about ninety feet east of Portland avenue, and westward to Parnell avenue, with side approaches on Portland avenue, Shields avenue and Butler street.

The substructure is under contract to R. F. Wilson, and is partly completed. The superstructure is being constructed by A. Gottlieb & Co.

This work should be completed about May 1, 1889.

The estimated cost, to be paid by the Pittsburgh & Fort Wayne and the Chicago & Western Indiana railroad companies, is as follows:

Substructure (estimated)	$ 97,947 61	
Superstructure	69,922 00	
Sundries	3,500 00	
Total		$171,369 61

BRIDGE AND VIADUCT REPAIRS.

Aside from the general repairs required in keeping the bridges and viaducts in running order, a larger amount was necessarily expended this year than any previous year in the city's history. One hundred and sixteen thousand, one hundred and twenty-nine dollars and sixty cents ($116,129.60) was spent exclusively in repairs during the past year; but chiefly in renewal of bridges and approaches. A larger proportion than usual, however, was expended on viaducts.

Digitized by Google

At Rush street, over fifty feet of docking was built on the east side of the north approach, for protection to the approach, and long fender-piles had to be driven outside the dock to prevent steamers from pulling it down. The bridge and approaches were re-planked, and the bridge raised in the center, which was made crowning and covered with tarred paper to carry the water off from the machinery and turn-table. The bridge is now in good condition to receive the increased traffic which will be caused while the new bridge at Clark street is building.

Besides the expense of lights and watchmen, heavy chains were bought for the fastenings on Dearborn street bridge.

At State street bridge the south approach was re-planked, a new set of locks put on, and important improvements made in connection with the machinery in turning the bridge.

The north approach at Clark street bridge had to be rebuilt and repaired to insure safety until the bridge was taken down.

The changes at Randolph and Madison street bridges for turning by steam, necessitated new and stronger turning gear on turn-tables. A new set of bearing wheels was put on Madison street bridge, and the center protection rebuilt with new piling; new fender clumps were also driven for protection to bridge and approaches.

Digitized by Google

The south half of the center protection at Adams street bridge was rebuilt, and new fender clumps of long piles driven at each corner of the center protection.

Jackson and Eighteenth street bridges were supplied by the Department with tools, oil, coal and sundries, fittings and boats; all of which have been charged to the bridge department.

The west abutment above the off-set, or bridge seat, at Van Buren street bridge, had to be taken up and rebuilt, and anchored back, as it was continually slipping out and jamming the bridge fast.

At Harrison street bridge, the turn-table was entirely rebuilt, likewise the south half of the center protection, and new fender clumps of piles driven at the south end of protection and at the east approach of the bridge, and new timbers on bridge seat.

The south half of the center protection at Polk street was rebuilt with new piling and fender clumps of piles driven at the four corners of the center protection, and a new set of bearing wheels put on the turn-table.

The bridge house at Twelfth street bridge was moved to accommodate the new viaduct, and fitted up with sub-basement for storage of coal. The west stone pier or abutment commenced to move out against the bridge and had to be secured with heavy long anchor rods.

Digitized by Google

The east approach at Twenty-second street bridge had to have extra timbering to maintain it until the new bridge at Eighteenth street was completed.

The stone abutment at the south approach of South Halsted street bridge commenced moving out after the channel had been dredged, and had to be anchored back with long tie rods, reaching back sixty feet from the face of the abutment to a heavy timber bedded down across the street for an anchorage, and the south approach was rebuilt and re-planked. The north approach was also re-planked.

Both approaches at Main street bridge were re-planked, and heavy sheet plank driven on both sides of the river to prevent the filling being washed out from the action of the water by the passing tugs and steamers.

A new steel track was put on the turn-table at Fuller street bridge, and sheet plank driven at the east approach to prevent the filling from being washed out.

The east approach at Archer avenue bridge was re-built and the bridge re-planked.

Fender piles were driven at Douglas avenue bridge, and new wheel bents put in at the approaches.

Both approaches and the bridge at Western avenue were raised and re-planked. Sheet plank were driven on the east approach to retain the filling in the street, and the bridge house was repaired and painted.

Digitized by Google

The bridge over the outlet of the Canal pumping works was taken down and rebuilt.

Kedzie avenue bridge was replanked. That part of Archer avenue slip bridge belonging to the city was rebuilt and painted two coats.

The Erie street bridge turn-table was rebuilt, and new piling put under the whole south half of the center protection. The bridge was painted two coats, and the bridge house moved across the river to a more favorable location, rebuilt and painted two coats.

North Halsted street bridge and both approaches were re-planked, railroad tracks being laid over the bridge at the time of re-planking. A new steel track is on hand for the turn-table.

Halsted street canal bridge and both approaches were re-planked and new timbering put in. The bridge stringers, sidewalks and railings were also renewed, and railway tracks laid over the bridge.

At East Division street bridge, heavy clumps of fender piles were driven at both of the approaches for protection, and the west approach was rebuilt with new piles on the north side of the approach, and a new wheel bent on the west approach.

At West Division street bridge, the curb walls on the east approach of the south side of the street gave way the entire distance, ninety-six feet of the basin having been dredged out some years ago for a stone and sand yard. This wall was rebuilt, and eighty feet of

Digitized by Google

dock built to protect the retaining walls, and a row of piles driven outside of the dock to support the sidewalk, which was all rebuilt and the east approach re-planked.

Street railway tracks were laid over the North avenue bridge. It was re-planked in the meantime, and both approaches rebuilt and re-planked.

Clybourn place bridge and both approaches were re-planked.

The west draw of Fullerton avenue bridge was dredged out, and six clumps of fender piles driven to protect the bridge and the west approach, which was repaired by putting in extra floor beams, and re-planked.

VIADUCTS.

At Clark street viaduct, the chords, truss-rods and stirrups, or hangers supporting the floor beams, were found in a dangerous condition from the constant fumes of smoke from passing locomotives, which is very much more destructive to the viaducts than all the traffic of heavy loads passing over them. All the stirrups were renewed, and all the truss rods which showed weakness. All the iron work was well cleaned and painted two coats of the best iron paint. Bents were placed under the center chord, where the greatest strain comes.

Digitized by Google

Wells street viaduct, of the same type or build, was completely renewed, with the exception of the top and bottom chords, which were thoroughly cleaned of all rust and painted two good coats. New sidewalks were built and bents placed under the bottom chords as near the tracks as practicable, shortening up the span to a considerable extent, and giving the structure great additional strength.

New sidewalks were built on Van Buren street viaduct and all the iron work well cleaned of rust and painted two coats of best prepared iron paint, and the chords re-covered and painted.

At Harrison street viaduct the roadways leading down to the coal yard on the south side, and the sand or stone yard on the north, received extensive repairs, both being rebuilt with new timber and re-planked. All of the old covering on the chords on the viaduct was taken off and the chords and connections thoroughly cleaned and painted two coats. A new wheel guard was put on both sides of the roadway and new sidewalks built, railing repaired and strengthened up and chords re-covered and painted.

Several of the principal viaducts, viz.: Polk, South Halsted, Erie, North Halsted, and Chicago avenue had to be repaired during the season on a foundation of five-inch planking. At Polk and South Halsted street viaducts, this was found to be in such a rotten condition it all had to be renewed. It was surfaced

Digitized by Google

and made even, and covered with three-ply tarred paper, to preserve the planking as much as possible.

At Erie, Halsted, and Chicago avenue viaducts, they having been built later, the planking was found to be in better condition. About one-third or one-half, however, had to be removed, and they were covered likewise with three-ply tarred paper, and well tarred before laying down the cedar blocks.

The double-track viaduct at Twelfth street, spanning the Burlington and Fort Wayne tracks, was re-planked. Street railroad tracks were laid over this viaduct and connected with Fifth avenue.

Iron stirrups for carrying the roadway at Canal and Sixteenth street viaduct were dangerously deteriorated by coal smoke and were all renewed, and the chords re-covered, cleaned and painted with two coats of paint, and the chord covers painted. A broad stairway was built at the south-east end of the viaduct, leading down to Sixteenth street. The planking on the roadway and sidewalks was also repaired.

The viaduct on the west side of the river, built in 1878, at Eighteenth street, from the river to the west side of the Pittsburgh & Ft. Wayne railroad tracks, a distance of over 600 feet, was constructed of pile bents, and one iron span of 200 feet. The pile structure was rebuilt entire. The tops of the piles were cut off one foot, substituting a bolster 12x12 inches by four feet long, to carry the ends of the 12x12

Digitized by Google

caps, leaving a space between the ends of caps, instead of butting the caps tight together, as had been done in building the old structure, in which the ends of the caps had become rotten and crushed, while the timber one foot from the end of the cap was perfectly sound. This result was owing to the want of air space for evaporation.

A wide and commodious stairway was built at the new viaduct at Indiana street, and some changes and repairs made at the west end of the approach.

The Desplaines street and Milwaukee avenue viaducts received quite extensive repairs on the roadways, besides the repairs of damages of two collisions caused by a wrecking car and a high freight car. The damages, however, were paid by the railroad company. These viaducts should be paved as soon as practicable, as it requires from 250,000 to 300,000 feet of lumber, including the stringers, to re-plank them, aside from the immense amount of labor connected therewith.

Digitized by Google

The amount expended in repairs and supplies on bridges and viaducts during 1888, was as follows or as near as may be:

BRIDGES.

Rush street bridge	$4,490 75

NEW TUNNEL WORK.

LAND.

Three shafts have been sunk and 480 feet of tunnel, six feet in diameter, built by the city, under the direction of Mr. Wm. Innes, who has had extensive experience in this class of work, since December 20, 1887, when the first shaft was started in Desplaines street, near Harrison.

From this shaft, at a proper depth, a 6-foot tunnel was started in a southwesterly direction, crossing the old 7-foot tunnel with about six feet of earth between the top of the old and the bottom of the new.

The ground was soft, swelling clay for a considerable portion of the way, but the drift was carried to a distance of 246 feet, when work was stopped there and another shaft sunk at the proposed site of the new Central pumping station on Harrison street. From this new shaft, a tunnel was started to meet the former one. The two drifts met, as anticipated, very closely.

A third shaft was sunk at the Fourteenth street works. More difficulty was experienced in a portion of this shaft on account of very soft, swelling clay, and about fifteen feet of it had to be lined with solid timbers.

The rest of the tunnel work has been done by Mr. Andrew Onderdonk, contractor, under his contract with the city.

Digitized by Google

A shaft was started at Peck court in the latter part of December, which was intended to be the land end of the tunnel, but a very extensive deposit of quicksand was struck at an elevation which rendered this impracticable.

The borings made during the summer of 1887 having proved unreliable, a number of new borings were made very carefully.

These borings developed the fact that nearly the entire area east of the river and south of Harrison street had a stratum of quicksand overlying the rock, varying in thickness from a few inches to several feet, and that the boulder clay lies in a comparatively thin stratum between the quicksand and the blue clay above.

This stratum of boulder clay was found to be deeper at Park Row than at any other point, and the shore shaft was located there.

An intermediate shaft was sunk in Fifth avenue, about midway between Harrison and Polk streets.

These land shafts, on January 1, 1889, had all been connected by tunnel, with the exception of 324 feet between Clark street and Fourth avenue.*

The ground between the Desplaines street shaft and the Fifth avenue shaft was generally good, although some bad places were met between the river and the Fifth avenue shaft.

* Since the above was written the connection has been made.

Digitized by Google

The ground eastward from the Fifth avenue shaft was pretty good for about 600 feet, after which veins of silt, carrying water, sand pockets, etc., were met with, rendering the work very difficult. This drift was therefore abandoned with the intention of drifting through from Peck court to meet it.

The ground from Peck court west has been very bad all the way, and a box heading has been run nearly the entire distance, making the work slow and expensive.

The only serious damage done to buildings occurred at the northwest corner of Michigan avenue and Peck court over this drift. Two two-story and basement brick buildings and a stable settled somewhat, causing cracks of considerable size to appear. The damages have been settled for by the contractor.

From Peck court south, the ground was variable in character, from fair to bad.

A drift was run southward for 505 feet, where a very bad bed of water-bearing silt was met with. The drift was then bulk-headed and left for a connection from the south from Park Row shaft, which was successfully made.

From Park Row south the tunnel was started towards Fourteenth street station. Here bad ground was encountered from the beginning and at the end of 264 feet work was stopped.

Digitized by Google

Borings at short distances developed the fact that for from 600 to 800 feet the vein of hard material was too thin to successfully run an eight-foot tunnel without enormous expense and delay.

It was therefore decided to run two six-foot tunnels through the bad ground and unite them again in one of eight feet diameter as soon as practicable.

The total amount of land tunnel work for the year is as follows:

CITY.

Three shafts	182 feet.
Six-foot tunnel	480 feet.

CONTRACTOR.

Three shafts	220 feet.
Eight-foot tunnel	264 feet.
Seven-foot tunnel	6,740 feet.
Six-foot tunnel	388 feet.

LAKE TUNNEL.

The eight-foot tunnel eastward under the lake was started in June and carried forward for 278 feet. At that point quicksand was met at the bottom and swelling clay at the top of the tunnel. This occurred July 19.

In this drift the contractor concluded to introduce a hydraulic shield, and about eight weeks were spent in constructing this machine and getting it into position.

Digitized by Google

Various improvements were made in the machine from time to time as circumstances suggested, but after a thorough trial and large expense it had to be abandoned.

In the meantime, accurate borings showed that while it seemed to be impracticable to run an eight-foot tunnel all the way, two six-foot tunnels might be run for about 1,200 feet and then unite again in one of eight feet in diameter, which was decided upon.

These tunnels will unite about 600 feet west of the government breakwater, where the hard stratum grows much thicker.

The capacity of two six-foot tunnels is about the same as that of one eight feet in diameter.

Since the six-foot tunnels were started, the work has progressed very satisfactorily.

TEMPORARY CRIB FOR SHAFT 2½ MILES OUT.

A steel structure consisting of two concentric steel shells, the outer one seventy-five feet in diameter and the inner one thirty-one feet, was built opposite Peck court on the Illinois Central Railroad dock. Its height was fifty-four feet.

An unsatisfactory attempt was made to launch it, but it did not go far enough to allow scows to approach all sides, owing to the settling of the ways near the dock.

Digitized by Google

An attempt was made to lift it afterwards, but it was unsuccessful.

Shortly afterward, during a storm, the underpinning at the outer side was washed out, and the outside fell to the bottom of the lake, cutting through the ways on which it rested.

An attempt was then made to raise it for the purpose of putting a bottom in it so that it might be towed out to its place in the lake, but another storm in the meantime racked it so that it had to be taken to pieces to save it.

The loss is at the expense of the contractor and not the city.

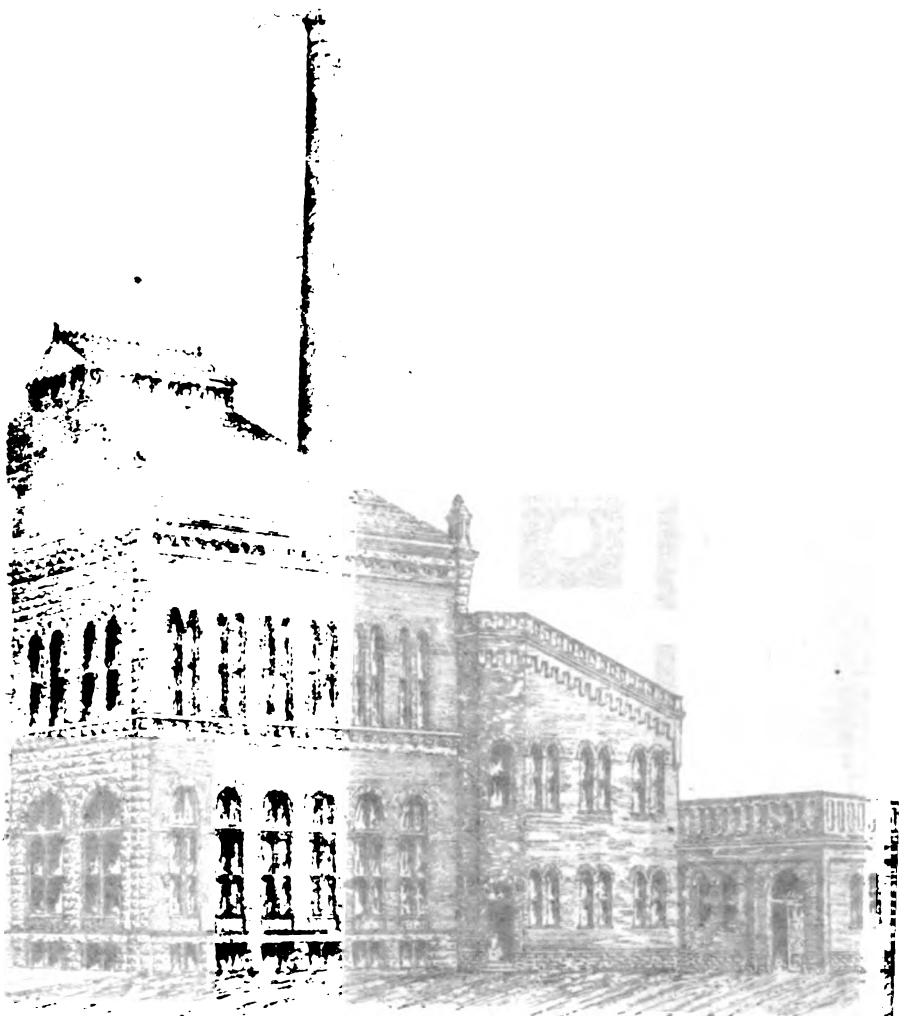
The contractor is now at work on a new structure for the same place which will probably be ready to launch by the time the ice goes out of the lake in the Spring.

CENTRAL PUMPING STATION.

The sites for new pumping works having been selected by the committee appointed by the Council for that purpose, and consisting of the Mayor, Comptroller, and Commissioner of Public Works, and the ground for the Central pumping station purchased, proposals were received for engines and machinery.

The contract having been entered into on April 13, plans were immediately commenced for a suitable building and foundations, and the work of excavating

Digitized by Google



CENTRAL PUMPIN
CHICAGO,IL
1888
Digitized by Google

Digitized by Google

was begun in June. By the middle of July the pit was ready for the foundation piles for the building, but owing to delay in procuring piles no further excavation could be done until about September 1, when work was begun on the pit for engine foundations.

Owing to the soft and yielding nature of the ground (very soft blue clay) extreme care was necessary in bracing, and the work was consequently slow; but by the last of October the bottom was reached.

The intention at first was to use ordinary piles under the engine foundation, but the soft nature of the ground rendered this a dangerous proceeding, and sand piles were resorted to—*i. e.*, rectangular pits, four by eight feet, were sunk to the hard stratum, and filled with sand well rammed in. This work was so far advanced by the middle of November that the footing courses of stone were started, the brick-work following up as the stone-work was finished. By December 31, the entire size of the brick-work had been carried up about twelve feet, and at the present time is up to the level of the foundation of the building.

From present appearances, the foundations and other work will be ready by March 1, to begin placing the machinery.

On September 28, a contract was entered into with Grace & Griffiths for the erection of the building. Contracts were also made for the cut stone, iron floors and roofs.

Digitized by Google

The building was to have been ready for the engines January 1, and completed April 15, but owing to the necessarily slow progress of the foundation work, the work of erection of the building has been delayed. The contractor is now about beginning his work, so that the completion of the building will be delayed until about June 15.

The material for the floors and roofs is all ready for erection, and can be put in place as soon as the mason work is ready for it.

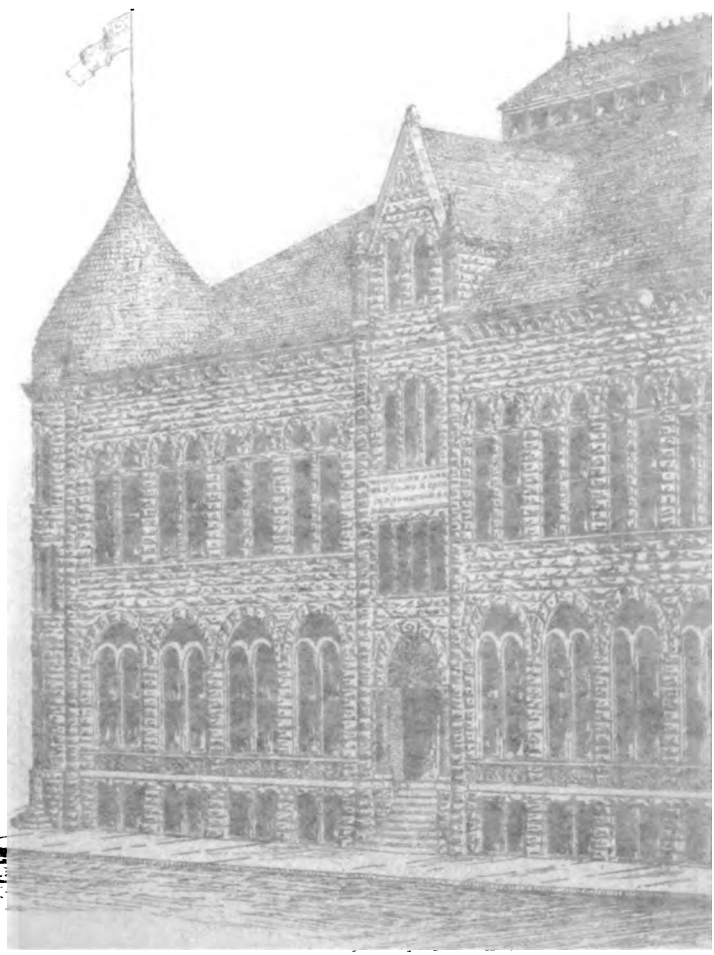
Connection will be made with the old seven-foot tunnel, whereby water will be furnished when the engines are complete.

FOURTEENTH STREET PUMPING STATION.

A site for a pumping station has been purchased on Fourteenth street, between Michigan avenue and the Illinois Central Railroad, general plans decided upon and complete plans well advanced.

A large amount of excavation has been done by the city, and fully one half of the foundation piles driven. At this place the piles under the engine foundations, which are about twenty feet deeper than the building foundation, are driven with a follower,

Digitized by Google



Digitized by Google

Digitized by Google

Digitized by Google

Digitized by Google

and will be cut off at the proper height, and capped when the excavation reaches them. A contract for the building will probably be made early the coming Summer.

OGDEN DITCH DAM.

On May 29, word was received from the watchman at the dam that the flood water from the Desplaines river was cutting a channel to the south of the dam and that the dam itself was in danger.

Mr. Wm. Innes was immediately sent out there with a gang of men and a temporary dam constructed across the new channel, which had cut to a width of about thirty feet and a depth of about ten feet.

Nothing could be done at the time of a permanent character, and later in the season an appropriation was asked, for the purpose of making permanent repairs. The amount estimated for this purpose was $5,000.00.

After examination by the Mayor, Comptroller and Chairman of the Finance Committee, together with the City Engineer, the appropriation was recommended to the Council and granted and the work ordered done.

The work is now about completed and the dam is considered safe against ordinary floods.

Digitized by Google

QUALITY OF WATER.

The quality of the water has been excellent during the year. Once or twice, in consequence of heavy northerly storms, the water became slightly milky, owing to clay in suspension, from the wash of the bluffs, but in no case has any contaminated or polluted water approached the crib.

The old tunnels are in good order, and during the past year have been used to their full capacity.

NEW INLET PIER.

This structure, after causing a great deal of tribulation to the contractors, was finally completed in August, '88, and is ready for use in case of necessity.

The iron light tower has in its lantern an electric lamp and reflectors, designed by William S. Chase, of this office, and was constructed by the Wheeler Reflector Co.

The height of the light is sixty feet above the water, and its rays are so brilliant that it is the first light seen from vessels approaching from the northward.

Digitized by Google

Digitized by Google

Digitized by Google

The electric current is supplied from the plant at the North pumping works, through a cable laid in the tunnel.

The cost of this structure has been as follows:

Substructure complete	$51,008 84
Light house, including lantern	2,490 00
Reflectors	90 00
Bell	200 00
Total	$53,783 84

LAKE CRIB AND BREAKWATER.

The breakwater, designed as a protection to the Lake Crib, was commenced early in the season by the contractor, and on July 30 the first crib was towed out and sunk to its position.

Everything has worked favorably during the construction, with the exception of one heavy storm which changed the alignment of the second crib slightly, and settled the exposed end of it about five feet.

The work was completed in December, and its effects are very perceptible to the occupants of the crib, who now scarcely feel the force of a heavy storm in the living rooms, while before the breakwater was built the crib swayed considerably.

The light tower shakes and sways very badly in a high wind, and its action must be detrimental to the

Digitized by Google

structure. It should be removed, and a light iron structure erected in its place, with an electric lamp in the lantern.

It seems questionable whether it would not be better to close the opening left in the west side of the breakwater with piles and rip-rap, in order to prevent the possibility of running ice forcing its way inside, where it might cause much damage.

The cost of the breakwater has been $149,430.28.

BUILDINGS FOR FIRE DEPARTMENT.

The following buildings have been erected for the Fire Department during the year 1888 :

Three-story and basement Fire Engine House at Illinois street, near Franklin street, for Company No. 42. Contractors, Hansen & Wilke. Cost.....	$11,895 00
Two-story and basement Fire Engine House at West Lake street, between Kedzie and Albany avenues, for Company No. 44. Contractor, D. H. Hayes. Cost.....	$8,865 00

Digitized by Google

Four-story and basement Repair Shop at Sebor street, between Halsted and Desplaines streets. Contractors, Grace & Griffiths. Cost. $13,629 00

In conclusion, I beg to return thanks to you for your courtesy and hearty co-operation in all matters connected with this Bureau.

I also desire to thank the Engineers and other employes of this Bureau for their zeal and attention to their several duties.

Very respectfully,

WM. R. NORTHWAY,
City Engineer.

Digitized by Google

VESSEL DISPATCHER'S REPORT.

CHICAGO, January 14, 1889.

HON. GEORGE B. SWIFT,

Commissioner of Public Works.

DEAR SIR:—I herewith present to you my report as Vessel Dispatcher for the season of navigation, commencing April 15, and ending December 1, 1888.

The continued operation of the Bridge Telephone system further develops its usefulness; pilots and bridge tenders having become more accustomed to its workings. The interruption of travel by the opening and closing of the bridges has been reduced to a minimum.

The whistle nuisance has been very materially lessened, and next year will probably be entirely abated. The offenders the past season have been steamers from foreign ports, whose masters are unacquainted with our whistling ordinance.

There are now in winter quarters in the Chicago river, two hundred and sixty-five (265) vessels, of which sixty-two (62) are steam and two hundred and

Digitized by Google

three (203) are sailing vessels. During the winter of 1887-8 three hundred and thirty-one vessels quartered here — a decrease of sixty-six (66) for this winter. The grain-carrying capacity of these vessels is five million, two hundred and sixty-six thousand (5,266,000) bushels — a decrease of five hundred and sixty-two thousand (562,000) bushels over last winter.

Following is a table showing arrivals, clearances and tonnage of vessels at the port of Chicago during each year since 1882:

YEAR.	ARRIVALS.		CLEARANCES.		TOTAL.	
	No.	Tonnage.	No.	Tonnage.	No.	Tonnage.
1883	11,203	3,555,586	11,271	3,743,574	22,474	7,299,160
1884	10,513	3,481,957	10,640	3,489,666	21,153	6,971,623
1885	9,846	3,347,647	9,910	3,364,169	19,756	6,711,816
1886	10,180	3,546,309	10,267	3,594,549	20,447	7,140,858
1887	10,828	3,868,465	10,920	3,989,615	21,748	7,858,080
1888	10,158	3,990,921	10,308	4,134,064	20,466	8,124,985

It will be seen that the arrivals and departures have decreased 1,282 over the season of 1887. This is more than balanced, however, by the increase in tonnage — this item showing an increase of 266,905 tons over 1887. The increase is attributable to the higher average carrying capacity of the vessels during the last year.

There came into commission this year fifty (50) first-class steamers, averaging fifteen hundred (1,500) net tons, the greater number of which have come to Chicago and entered the grain trade.

I would recommend that the telephone system be extended to include Eighteenth, Twenty-second and South Halsted street bridges, thereby giving the Vessel Dispatcher more and better control of the movements of vessels. Having no telephone connection with the bridges south of Twelfth street, it frequently occurs that the bridge located at this point is opened to allow one vessel to pass north, while other vessels are also moving north between South Halsted and Twelfth streets. There being no telephone report of the movement of these vessels, they are allowed to pass, making two or more openings of bridges from Polk to Wells streets, when, with the extension of the system as proposed, one opening of the bridges would answer.

I would also recommend that the river police be increased in number so as to rigidly enforce the law forbidding the throwing or dumping of refuse, offal, fruit, vegetables, slops from distilleries, and coal tar from the gas works into the river.

I would further recommend that Section 985 of the Municipal Code be revised, so as to give the Vessel Dispatcher the power to hold vessels more than ten minutes where the street traffic demands it.

Digitized by Google

The electric light system on the river has been a great help to navigation during the past season, which is proved by the fact that in numerous instances tugs with heavy tows and steamers proceeding without tugs have tied up until daylight after reaching the limits of the electric light plant. It is also of much benefit to the fire and police departments in having the docks well illuminated.

The electric light and telephone systems have proved themselves of great service to the public and marine in preventing the larger lake carriers from meeting at dangerous places in the river, and consequently saved the public, and smaller vessels as well, the unnecessary loss of time and money occasioned by such delays.

Respectfully submitted,

JOHN C. WECKLER,

Vessel Dispatcher.

WATER WORKS SYSTEM.

GENERAL REPORT.

CHICAGO, January 1, 1889.

HON. GEORGE B. SWIFT,

Commissioner of Public Works.

DEAR SIR:—Almost my first work, after being placed in charge of the water works system of the city, was to make a detailed report to you of the condition of the several pumping stations. I herewith respectfully submit a comparative report of the workings of the pumping machinery at the time I was placed in charge and the present time.

At Fullerton avenue conduit the engines were doing their work satisfactorily. A six months' test of oil as a steam generator was being made there at the time. The burning of coal was afterwards resumed, it being found the least expensive. The city lost nothing by the test, as the price of the oil was reduced to the amount coal would have cost.

Digitized by Google

At the Bridgeport canal pumping station the four engines were at work, but several of the wrought iron cranks on the engine-shafts were broken and temporarily repaired, until such time as more extensive repairs could be made.

At the West Side water works I found the four compound-beam engines all in working order; but a heavy trembling of the floor of the engine-room was perceptible. At the time, I ascribed this to a weak construction of the floor beams. The boilers were said to be in a fair condition, but were undergoing repairs when not in use.

At the North Side water works I found a very unsatisfactory state of affairs. The pumping engines in use at these works were built and placed in operation at various periods, as the demand required, between 1853 and 1887.

The oldest, a single-beam engine of 1853, appeared to be almost worn out. The column supporting the beam, was shaking and vibrating with every stroke of the piston, and the four wrought iron braces were bending and stretching with the shaky column, making the floor tremble perceptibly. The valves in the pumps made a loud knocking report with every change.

The second, a single-beam engine of 1857, was in a somewhat better condition, and was considered one of the best in the building. Both these engines were

Digitized by Google

working during the day. Their bad condition was said to have been caused by the great fire which, in 1871, partly destroyed the building and sprung some parts of the machinery.

The third, a small double-beam engine, built in 1867, was undergoing repairs. The water-pumps had been re-bored, new pump-pistons put into place, and the valve-gear on the steam-cylinders overhauled. The work was so nearly finished that I had no time to examine all details before the engine was again at work.

The fourth engine was built in 1872. This is the large double-beam engine in the south end of the building. Its cylinders are of seventy-two (72) inches diameter, ten (10) feet stroke with bucket and plunger pumps originally fifty-seven (57) inches diameter of bucket, forty (40) inches diameter of plunger, ten (10) feet stroke, and should furnish about 36,000,000 gallons of water in twenty-four (24) hours. Its working struck me as peculiar. The weight of all the machinery seemed to hang on one end of the walking-beams; the down-stroke of the steam-pistons was quick and the up-stroke rather slow. The whole building was trembling on account of this uneven motion. The engine-frame itself was shaking so that the platform around the beams was a very unsafe foothold for the engineers and oilers. The upper rooms in the building were useless on account of the trembling, but the engine had to be kept going day and night to supply the city with water.

Digitized by Google

In an annex to the main building are located the newest engines—two pairs of the Gaskill manufacture, built in 1886. They began pumping in 1887, and at the time of my examination were apparently working well. An official test had just been made on them, and, as it had not yet been reported, I did not examine them particularly.

It is pertinent here to mention an incident which happened shortly after my arrival in Chicago. Turning the faucet in my room at the hotel, the water was thrown out with great force. It was propelled by a large quantity of compressed air in the pipes, and was fairly blown out of the wash-bowl by the force of the air behind it. Filling a glass with the water, I found that it looked perfectly white, but as the air escaped it became clear.

At the time, I supposed the hotel pump was responsible for the disorder in the water-pipes and thought no more of it. During the day, I made my first visit to the North Side water works. I there saw several air-compressors in operation, which the engineer in charge told me were necessary to make the engine work quietly, by forcing air into the water-pumps. My experience with the hotel faucet came to my mind, and I commenced to investigate.

I knew that all pumping engines required a small quantity of air to keep the air-chamber on the discharge-pipe supplied with its proper quantity. This

Digitized by Google

is necessary, as the air, under pressure, somehow works out of the air-vessel, either through the small pores in the cast-iron, or through other leaks, causing the engine to thump. This air can be easily introduced through a small pipe with check and regulating valves on the suction side of the pump, or a small force-pump may be used to supply the air-chamber direct with air, for an air-cushion. It is also a fact, that in cases where air enters the valve-chamber with the supply of water, a quiet working of the pump and of the valves is impossible. But I never had seen regular air-compressors used, or air in such quantities forced under pressure into water-pumping engines, and naturally I was interested to find the reason for it.

A few days later the double-beam engine of 1867 was started up again and it seemed to work all right; but for some reason the engine looked as if it did no heavy work. It worked too easily. A try-rod over one of the discharge-valves in the pump-chamber showed plainly that the valves did not close quickly enough at the end of the stroke. It required quite a little time for closing, even after the pump-piston was again on its down stroke. Much of the water ran back from the main into the pump, and from the pump into the well. I found, on inquiry from the engineers at the works, that the valves in these pumps had been changed several years since, and that valves similar to those in use in the big "'72" engine were substituted for the old ones.

Digitized by Google

In the basement of the engine-house were stored a number of brass double-beat valves, which had been removed from the "'72" pumps in 1877-78, when new valves of a different construction were put in. On further investigation I found the patterns of these new valves, which disclosed at once the fact that they could not work — for reasons which I will explain hereafter.

In the meantime the engines were all working at their full speed. Every faucet in the engine-house discharged more air than water, as appeared to be the case all over the city.

One morning early I saw a man working at a hydrant, and found he was trying if it had frozen during the cold night. On hearing the air blow out of the try-cock, he was satisfied. He tried it again for me and I explained how the air would force the water back from the hydrants if they were not in constant use. The only real benefit from the air in the water appears to have been that it kept the water from the hydrants and thereby prevented their freezing and bursting.

The air in the water was a great detriment in case of a fire. More air than water came from the hose, and it was impossible for the engines to throw a solid stream of water at any time. The air-vessels on the fire-engines were often ruined by the undue quantity of air coming from the hydrants. It had been

Digitized by Google

explained that this difficulty arose because the water could not follow the rapid workings of the pump-pistons on the fire-engines.

I learned that many complaints had been received of lack of water in upper stories, of noise in the pipes at night, and that a loss of over twelve pounds of pressure existed between the North Side pumping station and the immediate neighborhood west of the tower, after the water had passed the tower.

Investigating this, I found in the pamphlet "Preliminary Report of the Drainage and Water-supply Commission of the City of Chicago, of January, 1887," page 40, a diagram, showing the water pressures in the Chicago water-mains in December, 1886. Thereon is shown a decidedly lower pressure in the pipes west of the tower. The reason given—that the complex arrangement of the delivery pipes on the pumps at the North Side and the small area of the pipes caused this - is not correct.

It may have caused some of it; but the greater loss of pressure was because a part of the air, which was forced into the pumps artificially in the engine-house, escaped through the open stand-pipe when the water was passing below. The balance of air in the water was passing along in the water-mains and accumulated in the upper ends of the pipes in houses, hydrants etc., and caused the rattling noise in the water-pipes at nights, or the spurting through open

Digitized by Google

faucets. The escaping air through the stand-pipe caused the water to foam so much that the foam at times ran over the top of the pipe, the air blowing out at the top with force. This caused the pressure to fall west of the tower, as the pressure of air in the water showed on the gauge as if it were water, and on having escaped, reduced the pressure to that extent.

This explains also the freezing of the tower about seven years ago. The foam froze to the sides of the pipe and gradually closed up the free opening. The air could not escape and the city mains contained more air than water. The tower had to be thawed out with fire-pots, and when at last the air could escape, it made the tower tremble for hours.

Another circumstance seemed to favor me in my investigation. A defect in some of the air pump valves on the large "'72" beam-engine made it necessary to shut this engine down, and the next morning the work of taking it apart for general repairs was commenced. The air-compressors were also stopped when the big engine ceased to run.

The effect of losing such a vast amount of water as it was supposed the large engine was furnishing was hardly noticeable. On the contrary, there was less air in the pipes, and the water was more solid; but by no means was all air excluded from the engines which were still working. The "1867" engine had a number of pipes attached to the valve chambers,

Digitized by Google

they being considered necessary to the working of the pumps. One of them, an eight-inch diameter pipe, as was found out later when removing it, had a number of check valves in it. These were perforated and produced a water white as milk, caused by the water being churned thoroughly with air drawn into the suction valves of the pump and mixed with the water in these auxiliary pipes. The old beam engines had also air pipes attached to their pumps to supply all air possible for the air vessels, and to make the pumps work smoothly. The air vessels were full of air to the bottom, and the superfluous air was forced with the water into the city mains. Nothing but the usual amount of wear and tear on the valve motion and on the connections of the "'72" engine was found. Only the rubber valves for the air pump needed to be replaced by new ones.

The pump well was pumped out and the pumps examined. The suction and discharge valves of the service pumps were in good order and perfectly tight. The wooden seats of the valves were as perfect as they probably were when put in nine (9) years before,—but we found the pump barrels of both pumps cracked from top to bottom, and a new inside cylinder or sleeve inserted in each pump. The original diameter of the pumps had been fifty-seven (57) inches, now they were fifty-four (54) inches. The space between the new cylinder and the old cracked pump

Digitized by Google

cylinder was filled with sulphur, and the inside cylinder held in position by set screws. A small iron band was clamped around each of the broken cylinders. A ring over the top and at the bottom of the pump cylinder, with four rods on the outside of the old cylinder kept the inside sleeve in place.

I found later from the bills on file that these inside cylinders were put in the pumps in the early part of 1879, but no official report of the accident to the pumps can be found in the yearly reports, or when these repairs were found to be necessary, or what caused the pumps to burst.

But it is plain how it must have happened. When the new valves were placed in the pumps in 1878, and the engine was started, it was found the valves would not work. The pump well was nearly full of water when the gates were open to the tunnel from the lake, and the suction valves were so low down that the pressure outside of the pump would not let the valves seat. To make them seat, the gates were partially closed so that the water in the well could not rise so high; and at some time the water must have gone too low. Air came into the pumps through the suction valves, and the buckets of the pump on their down stroke hit the water in the pump cylinders in mid-stroke and burst both pump barrels at once. Each is cracked in identically the same way. The pumps were kept going, and the loss of water from

Digitized by Google

the mains through the open cracks was so great that the pumps were shut down for investigation. The state of affairs was then discovered,—but nothing was said about it in the official reports.

After the engine was repaired, new means had to be used to make the pump valves work. The pounding of the valves is said to have been terrible. The air-cushion was now brought into requisition. At first a small quantity of air was used. This was gradually increased, as is plainly seen from the official reports, of which I will quote extracts later, referring only to this big "'72" engine.

I found at the North Side water works several air compressors for this purpose. One duplex double-acting machine with two (2) air cylinders, each 9½ inches diameter, eight inches stroke, running usually eighty (80) revolutions per minute, and could furnish about one hundred and five (105) cubic feet of air at atmospheric pressure; another with two (2) cylinders, which at forty (40) double strokes per minute could furnish about thirty (30) cubic feet of air; and a third one which could furnish about fifty (50) cubic feet of air per minute. This last one was used as a water pump, when the well had to be pumped dry. When the "'72" engine was running, it was employed to pump air for the engine.

The three pumps together could easily furnish two hundred (200) cubic feet of air at atmospheric

Digitized by Google

pressure per minute. This was pumped into a receiver under a pressure of twelve (12) pounds above atmosphere, and from this receiver the air was led by means of pipes into the suction valve chambers of the pumps.

Later on, a drawing was found among the old papers in the office of the water works, which shows plainly the intended improvement in pumping engines, and which dates back as far as January, 1877. When it was plain beyond a doubt that all the trouble had been caused by the misconstructed valves in the pump chambers, new valves of a different construction were ordered and made, and placed in the pumps. In the meantime the whole engine itself was overhauled.

Many queer things were discovered while this work was going on. A six-inch nozzle and valve were on the delivery main for the purpose of being opened to let the water run back into the pump well from the water mains, when the pressure became too great. The water was pumped up to let it run back! The general marched up the hill and then he marched down.

But it was a hazardous thing to stop the big engine, and it had to be kept going. It required five or six men to handle the starting bars and adjust the cut-off when the engine was started. Then the air-compressors had to force air into the valve-chambers to cushion the valves of the pump. I was told that on several occasions it took a day or more to accomplish this.

Digitized by Google

The engine was always running away when the heavy pistons and pump plungers on their down strokes made the whole building tremble, because there was air alone below the buckets to balance the load. On the natural air pipes some of the check valves were placed with the wrong end toward the pump. The natural consequence was that they spouted out water instead of drawing in air, and the regulating valves had to be kept closed.

Each pump had a thirty-six inch discharge pipe; but outside of the building these two pipes had been drawn together into one pipe of the same diameter only, which had a bad effect upon the free discharge of the water from the pumps. During the repairs of the engine, a new connection was made from the south engine discharge pipe to the twenty-four inch main leading through Pine street, thus relieving the contracted pipe and the engine from any bad back pressure.

A similar state existed on the "'67" double engine. Each pump had a twenty-eight inch delivery pipe, connected to one pipe of the same size inside the building, causing a back pressure of about four (4) pounds. A new twelve-inch connecting pipe is now laid from the air chamber below its water-line to the delivery pipe of the "'53" engine, and a great part of the back pressure consequently removed.

Digitized by Google

On the "'72" engine, there has been put on each pump an eight-inch pipe with an eight-inch gate-valve, which connects the space above the discharge valves with the suction valve chamber for the purpose of starting the engine easily. The pressure of water above the discharge valves is brought below the same and the pump bucket is easily started on the up stroke in both engines by letting steam slowly below the steam pistons in the cylinders. As soon as the engine is moving, these by-pass valves are gradually closed and the suction valves supply the necessary water to fill the pump.

A simple arrangement for keeping the throttle valve in the steam pipe under perfect control, when the engineer admits steam into the steam cylinders, has changed the difficult starting of the engine into an easy task. The fact that water instead of air now fills the pumps, makes the running away of the engine at the start impossible.

On May 29, the big engine was ready to be started again, after new valves had been placed in the pumps. The pumps worked noiselessly and the engine itself has since been running very well without the use of any of the air compressors. When the big engine started to pump, the water rose in the tower nearly thirty (30) feet. This made the two single-beam engines stop running, as they were not able to pump against such a head of water.

Digitized by Google

It is not well to have such large engines, supplying 32,000,000 to 36,000,000 gallons of water, where the pumps force the water direct into the mains and not into a reservoir. Should such an engine stop suddenly, the difference of supply is too great, and a serious accident may be caused by it to the other engines.

During the summer, when the capacity of the pumping engines was tried nearly to their full power, an intended change of the "'67" double-beam engine to a compound-beam engine could not be undertaken, but as soon as cooler weather set in, this engine was stopped for the change. In the meantime, the old "'53" engine had to be overhauled, as it was working so badly that it would not do to run it longer. The metal flopper valves in the buckets and in the suction-valve plates of the water pumps were removed, and new brass valve plates with small rubber valves, substituted. The braces on the column which carries the beam, have been supplied with turnbuckles, to keep tension on the braces and prevent the column from rocking. By these changes, this engine has been improved so that it is working better than at any time before. It is noiseless and the pumps work perfectly. The engine can now more easily make twelve (12) or thirteen (13) revolutions per minute than it previously made eight (8).

Digitized by Google

New valves, similar to the ones made for the pumps of the "'72" engine, were already placed in the pumps of the "'67" engine, and improved the working of the pumps considerably. This "'67" engine was a double low pressure condensing beam engine. It had two steam cylinders of forty-four (44) inches diameter each, eight (8) feet stroke, and used steam of from twenty (20) to twenty-two (22) pounds pressure above atmosphere. One of the large boilers, twelve (12) feet diameter, which had been generating steam for this engine, had been condemned as unsafe to carry even such pressure. After it had been removed, two new horizontal tubular boilers of five (5) feet four (4) inches diameter, and eighteen (18) feet length, with sixty (60) four-inch tubes were placed in the boiler house. They have been constructed to carry 100 pounds pressure above atmosphere. This steam was to be used to supply the "'67" engine after it was changed to a compound engine.

The furnaces under these new boilers burn soft coal, which, by using the Murphy self-stoking device, make as little smoke as the other furnaces, burning hard coal. Ever since these boilers were ready for use they have supplied steam for the low pressure engines, and we have demonstrated that for every ton of soft coal thus used, one ton of hard coal has been saved, which makes a saving of nearly $3.00 per ton of soft coal burned.

Digitized by Google

A twenty-six inch diameter steam cylinder has been placed inside the forty-four inch cylinder; a new bottom and a new top have been made to receive and hold the small cylinder and a new steam piston for the same. These are all the new parts made for the compounding of the old engine, besides the necessary steam pipes to carry steam from the new boilers to the engine, and the exhaust pipes from the high pressure to the low pressure engine. The space between the twenty-six inch and the bore of the old forty-four inch cylinder, which surrounds the small cylinder, is made a part of the receiver. All other parts of the old engine such as steam chests, side pipes, valves and the whole valve gear, were used without change, and the air pump, driven by this engine, was disconnected. When this compound engine is running, the steam pressure on the new boilers is raised to eighty (80) or ninety (90) pounds above atmosphere, and when the engine is stopped, the steam pressure is lowered again to twenty (20) or twenty-two (22) pounds, and is used for the low pressure engines. The soft coal furnaces are kept in operation, thus saving on the hard coal.

Referring now to the cause of trouble on the large "'72" beam engine, the wrong construction of the pump valves put in during 1877–'78—let us compare these new valves with the old ones. When this "'72" engine was built, fifteen double-beat valves of brass

Digitized by Google

were furnished for the suction chamber, and twelve (12) valves of the same size for the discharge chamber of each pump. The valves were constructed in the usual way—lower diameters of valve seats $15\frac{5}{16}$ inches and $16\frac{1}{2}$ inches, upper diameter of valve seats $12\frac{9}{16}$ inches and fourteen (14) inches. Each valve had 30.15 square inches of ring surface for lifting and 89,875 square inches for floating or resisting to close. Each valve weighed seventy-five (75) pounds in air, or sixty-six (66) pounds when submerged in water, requiring nearly two (2) pounds of vacuum per square inch for lifting, if there were no head of water in the well to help lift them. A number of these valves were yet stored in the building in the early part of this year. These valves probably worked noisily, but well enough to fill the demand, as the official test of the engines was made with them in their places. The Citizens' Association afterwards made a test on December 12, 1874. At that time the engine developed 1,339,951 horse-power, pumping water against a head of 150 feet, the pumps working at the rate of 38,771,976 gallons in twenty-four hours, being $7\frac{1}{16}$ per cent. in excess of the contract requirement. The engines, however, were not used for this extreme work. The head was reduced so that the engine afterwards used only 669,276 horse-power to do the work.

The brass valves were for some reason taken out of the pumps and new valves placed in them. This did

Digitized by Google

not improve the working of the pumps. The new ones were double-beat valves of cast iron, with wooden seats. The clear opening of the fifteen (15) suction valves was 657.9 square inches less, or 28.4 per cent. less than the opening in the old valves. Each valve had a lower diameter of valve seats of $15\frac{1}{16}$ inches and $17\frac{5}{16}$ inches and an upper diameter of valve seats of $8\frac{11}{16}$ inches and $10\frac{9}{16}$ inches, or a ring area of 90.57 square inches for lifting and 175.67 square inches for floating. Each valve weighs 122 pounds in air or 105.12 pounds under water and requires only 1.16 pounds of vacuum for lifting, against two (2) pounds on the old valves. The weight to close the valves under water was only 0.59 pounds per square inch, against 0.73 pounds for the old brass valves. The area of lower inside diameter of valve bell in proportion to the clear opening at top of valve bell was, on the old brass valves, 181.15 square inches to 90.36 square inches, or as 100 : 49, while the same on the new cast-iron valves was 178.19 square inches to 38.9 square inches, or 100 : 21.8. This large ring area of the valve bell, with only 0.59 pounds weight per square inch for closing, acts like a parachute and keeps the valve suspended or floundering in the water instead of letting the valves seat quickly when the bucket of the pump arrives at the top of its stroke. This caused the valves to set heavily after the pump-bucket had started on its down stroke, the current of water passing

Digitized by Google

through the yet open valves backward, carrying the valves down with force. If the pumps take solid water, and the valves are made in such a way as to automatically adjust their lift, necessary to let the water follow the bucket, and close gradually by the time the bucket is at the end of the up stroke, the valves will make no noise and the pump will do its full duty. On double-beat valves the difference between the lower and upper valve faces should be as small as possible —enough only to let the vacuum, formed by the bucket moving away from the valves, lift the weight of the suction valves easily so that the water can enter through the valves. The weight of the valves must be great enough to act continually, so that the valves may be seated as soon as possible after the speed of the bucket diminishes. This prevents any thumping of the valves and any loss of water by running back through the floating valves.

The apparent effects of the introduction of air into the pumps at the suction ends were, that the pumps worked more easily and the valves more quietly. But the new West Side pumping engines had commenced to pump at about that time into the city mains, or a deficit in the quantity of water would have been easily detected.

But let us see how it worked: The water in the well outside of the pump stands about eight (8) or ten (10) feet above the suction valves, or it would exert

Digitized by Google

a pressure against the bottom of the valves to open them, of about four (4) pounds to the square inch. The weight of the valves was only 0.59 pounds to the square inch, which would leave 3.41 pounds of pressure to open them and would float the valves until the pump was filled nearly level with the water outside. But air of twelve (12) pounds pressure above atmosphere was forced into the suction valve chamber, which kept the valves down. The buckets are fifty-four (54) inches in diameter with ten (10) feet stroke. The capacity of each pump is, therefore, one hundred and fifty-nine (159) cubic feet. Each pump received about one hundred (100) cubic feet of air at atmospheric pressure, and if the pump made ten (10) strokes per minute, would give ten (10) cubic feet of air for each suction of the pump, and this amount of air had to expand before any water could be drawn up above the level of the water outside of the pump barrel. The pump could not fill with water on account of this air. The valves, on account of their small weight per square inch, and on account of their small opening at the top, floated and could not seat quickly enough. The bucket descended and compressed the air slowly, while a part of the water in the barrel ran back into the well through the still open valves, which only closed slowly during the increased velocity of the bucket on its down stroke. When the valves closed, no jarring was felt, on account of the air-cushion above the water in the pump-barrel. The air was

Digitized by Google

now further compressed and forced into the mains with the water through the delivery valves. A new up stroke commenced; more air came in from the receiver and compressors and the same operation was repeated, as before.

The loss of water must have been immense. This had been going on for ten years, or, from the early part of 1878 to 1888. The engine had been kept going continually with only a few days of rest in each year, as can be seen from the yearly reports.

But the alleged marvelous performance of this big "'72" engine was at last seriously doubted. The quantity of water used in the city per capita was enormous. The quantity of water pumped was more than the tunnels could furnish.

The report for 1887 says: "This double engine '1872' has been credited with running 8,674$\frac{10}{60}$ hours last year, and with making 4,680,987 revolutions, pumping at 2,245 gallons per revolution, or 10,522,285,-815 gallons. From observations recently made and reported, it appears that this estimate is very much too large; and from later observations our mechanical engineer is doubtful if the engine is adding much, if anything, to the city's water supply."

According to this report, the engine was run 8,674 hours, or three hundred and sixty-one (361) days during 1887. Every day there were burned twenty-four (24) tons of hard coal to supply steam. This coal, at

Digitized by Google

$6.25 per ton, cost $150 a day or $54,150 for the year's work. During the nine years the engine has been in operation the coal bill has amounted to $487,350! And for this but slight benefit has been received. This amount does not include the salaries of engineers or firemen, cost of repairs, or any other expense connected with the running of the engine or the damage caused by the nonsensical use of air in the pumps.

The amount of water supposed to be pumped by the combined engine power of the North Side and West Side water works January 1, 1888, was about 130,000,000 gallons daily. Supposing the population of Chicago to have been at that time 700,000, this would make a daily consumption of nearly 200 gallons per capita — a very large amount as compared with other cities.

In spite of this apparent abundance, complaints of the scarcity of water were loud and continued. The pressure was so small that hardly a second story in the city was supplied with water. Those living in third stories and higher had no water whatever from their pipes unless forced up by an engine in the building. Everyone was put on a short allowance as far as was practicable. Water for sprinkling streets, lawns and gardens could only be had at certain hours and under certain restrictions.

After the large engine was repaired and running, I made a comparison of two months of the pumping last

Digitized by Google

year, 1887, with two months of this year, 1888. The time the computation was made last year was between August 15 and October 15, in order to include the work of the two Gaskill engines which had been started a short time before. The two months in 1888, during which a computation was made, were between June 15 and August 15, when more water is used than during any other two months in the year. You will notice from the figures that the engines at the North Side plant worked considerably less this year than last. The "'57" single-beam engine did not run at all, or made 85,402 revolutions less; the "'67" engine made 51,817 revolutions less; the "'72" engine made 13,506 revolutions less, and the Gaskill engines made 195,112 revolutions less. This resulted (reducing the quantity to a volume in gallons) in the pumping of 250,501,220 less gallons of water during the two (2) months of this year. The consumption of coal was two hundred and sixty-seven (267) tons less, which, at $6.27 per ton, reduced the expenses in fuel $1,674.09 in these two months.

The four engines at the West Side water works ran faster during the two (2) months this year, making together 633,630 revolutions more and giving an increase of 2,689,363,916 gallons over an equal time in 1887. They consumed five hundred and seventy-three (573) tons of coal more, which, at $3.30 per ton, added $1,890.90 to the expenses in fuel there.

Digitized by Google

Deducting the $1,674.09 saved at the North Side water works, the cost for the greater quantity of 2,438,862,-696 gallons is only $216.81 or 8.8 cents for every 1,000,000 gallons above the imaginary quantity of water pumped during the two (2) months of last year.

I need not tell you that the supply of water during this summer has been abundant and satisfactory to the citizens.

Taking into consideration the facts that there were laid from August 1, 1887, to August 1, 1888, 217,170 feet of water mains, in sizes from four to sixteen inches; that from October 1, 1887, to August 15, 1888, 8,330 new service taps were put in throughout the city and that part of Jefferson supplied from the same engines, which hitherto could not supply Chicago alone with water; that all restrictions as to the use of water have now been removed and that everyone has all the water he wants at any and all hours — taking all these facts into consideration it is evident that great mischief and damage were done from 1878 to 1888 by introducing air into the service pumps in order to make a good showing at the pumping stations, or to make the pumps work quietly on account of misconstructed valves.

EXTRACTS FROM THE OFFICIAL REPORTS RELATING TO THE "'72" BEAM ENGINE FROM 1874 TO 1885.

1874. Page 35. "Sand caused considerable damage to the metallic packing in pumps etc. These were the only repairs of note since the completion of the engine, which has given entire satisfaction."

1875. Page 39. "By referring to the table on page 32, it will be seen that the south engine has been in operation over ninety (90) per cent. of the entire time since the date of last report, and has pumped over eighty (80) per cent. of the whole quantity of water consumed in the city. * * * The operations of this engine, while performing so large a proportion of the work, have proved entirely satisfactory, especially in regard to stability and smoothness of action, without the slightest accident or undue wear."

1876. Page 37. "The south engines have been in continuous operation ninety-one per cent. of the time during the past year, pumping more than seven-eighths of the total quantity of water. The pumps of the '1867' engine, at present writing, are being fitted with new valves, which will be completed in the course of two (2) or three (3) weeks."

1877. Page 45. "Engine '1872' received pretty general overhauling during January and part of February last. Both working beams were taken out of

Digitized by Google

pillow blocks, in order to fit new keys in the main journal shaft. Other repairs were made upon the pumps, a portion of the foundations, and wherever necessary."

"An apparatus has been devised for the purpose of introducing an air cushion in the main water pumps. This device has proved very satisfactory in its operation, relieving the engine of any jar or concussion whatever."

"After repacking and cleaning the engine referred to, it was started on February 17, 1877, and has continued to run night and day to date of this writing, March 31, 1878."

1878. Page 40. "This south engine '1872' has been in operation 287 consecutive days and nights."

"The two double engines at the North Side works, and the two single engines at the West Side works are in reality the main reliance of the city for water."

Page 41. "Early in the year a new air compressor was connected to the engines for the purpose of creating a suitable air cushion in the pumps for the purpose mentioned in the last reports."

1879. Page 33. "The thorough refitting of the pumps of the '1872' engine referred to in the last annual report, was completed in June last, and has proved a great improvement. The engine was started soon after, and has continued in operation day and

Digitized by Google

night since that time, working in the most satisfactory manner, and at the present time is in prime condition. No accident or breakage of any kind has occurred during the past year."

1881. Page 33. "The operation of North works has not been interrupted during the year from any cause. The pumping machinery is in good order."

1882. Page 57. "The south '1872' engines have pumped over two-fifths of all the water delivered from these works, and have been running 343 days, having stopped about eighteen (18) days for overhauling."

In 1883, "the south '72' engines have pumped over five-eighths of all the water in 353 days in the year."

In 1885, "the south '72' engines have been in continuous operation, except one or two stoppages of a few hours duration, from May 6, to November 25."

In 1886, "the '72' engines have been in operation 361 days."

These extracts from the official reports show that this "'72" engine has been in this condition since February, 1878, and has been credited with an immense amount of work, which it did not perform.

After I had the work on the repairs of the "'72" engine at the North Side water works well under way, I went to the West Side water works to get

Digitized by Google

better acquainted with the affairs at that pumping station. This station had been looked upon for a long time as the model pumping works, and I found everything in apparently good order.

The four compound-beam engines were of modern construction; the high pressure cylinder forty-eight (48) inches diameter by six (6) feet stroke; the low pressure cylinder seventy-six (76) inches diameter by ten (10) feet stroke; the pumps, of the bucket and plunger variety, fifty-two (52) inches diameter and ten (10) feet stroke, driven direct by the piston rod of the low pressure cylinder. Two of these engines were built in 1876, the other two in 1884.

The boiler house contained twelve (12) boilers, eight (8) of which were in use when all four engines were running. Many improvements were made in the boiler furnaces and the superheating of the steam before it reached the engines. The steam cylinders were not steam jacketed; only the cylinder heads and bottoms were heated by steam from the boilers. All necessary preparations and contrivances were on hand to make accurate evaporation tests, and this station was used for years to give the comparative value of coal, according to the tests made there by the chief engineer of that station.

I found in the basement of the engine house two air compressors, one for each pair of engines, in full operation, making each forty-six (46) to fifty (50)

Digitized by Google

double strokes per minute. The air was forced into a receiving tank and from there passed into the suction chambers of the pumps, in the same way as was practiced at the North Side water works.

To get at the amount of air being pumped I had the back head of the air cylinder removed. The compressor was stopped about half an hour while the pumping engines were in operation, but no change of action of the pump or valves was noticed. This confirms me in my theory that the air which was forced into the valve chambers of the service pumps was not necessary, as had been claimed, and only worked against the very object for which the pumps were to be used, viz., to supply the city with water and not with wind.

I found the two air cylinders to have each eleven (11) inches bore by sixteen (16) inches stroke, and could furnish, at forty-six double strokes per minute, 3,040 cubic inches of atmospheric air for each double stroke or eighty-one (81) cubic feet per minute, which was forced into the pump barrels on the up strokes of the pump buckets, and which caused so much loss of water.

Besides the air furnished by these compressors, more air was drawn into each pump through several air pipes which were attached to the suction chambers and were provided with check and stop valves. These air pipes should have supplied sufficient air for the air

Digitized by Google

chambers, but I found here the same trouble as at the North Side. The location of the air chambers was back of the delivery outlet from the discharge valve chamber, and its connecting nozzle was below the highest space in the delivery chamber. The air, which was mixed with the water, flowed out with the current and did not work backward to the air vessel. Therefore, not much relief was brought to the air chamber, the air being forced into the city mains.

At the present time a small three-fourth inch pipe with check valves supplies air enough for two big air chambers to keep them supplied with air for air cushions.

I repeated my visit to the West Side pumping station, and explained to the Chief Engineer what I had done on the previous day without the slightest injury to the engines. With the words, "Come, let us try it again," we walked together out of his office, and started for the lower floor of the engine house where the air compressors were located.

The compressor at the south engines was stopped, and, as on the previous day, no change was observed. Then the air compressor on the north engines was stopped, with similar results. As soon as we arrived on the upper floor, however, a heavy thumping of the eastern engine of the northern pair commenced, which gradually increased until I asked to have the compressor started again slowly. The thumping of

Digitized by Google

the engine then ceased. I wanted to see how fast the air pumps must run to stop the noise, and on going down stairs suddenly I observed one of the oilers quickly opening the natural air cocks on the pumps, which supply all necessary air. I checked the motion of the compressor down to about five double strokes per minute, which then hardly forced any air into the pump, but the engine kept working quietly. On arriving on the upper floor the engine commenced to work badly again, for the reason that the oiler shut off all air again from the pumps as soon as I had gone up stairs. Another oiler, who had also noticed what was going on, and fearing some serious results, asked the assistant engineer if he wanted all the air cocks closed. He was ordered to open them at once, and all thumping ceased.

My report to you of the above occurrence resulted in the summary discharge of the Chief Engineer.

The air compressors have since been disconnected. All pumps work well by using only the necessary air cocks for the air chambers, and they now pump solid water.

I found here also that the evaporation tests were made only for eight hours, the same length of time as the engineers, oilers, firemen and coal-passers were on duty. This time is too short for any accurate tests of evaporation. It should be carried out for at least twenty-four (24) hours. But for a comparative test

Digitized by Google

of different kinds of coal, it may be sufficient, provided the men take more than ordinary care in leaving fires and height of water in the boilers in the same condition at the end of the trial as they find it at the beginning.

There are four boilers used to generate steam for each pair of engines, the steam being carried from the boilers through a main steam pipe to both engines, and all steam used for the compressors, steam pumps, jackets and for heating the building was taken from this main steam pipe connecting the four (4) boilers. I noticed that the men measured only the water for two of the boilers, and also took account only of the coal which was used for these two boilers, while the steam generated into these two entered in common with the steam from the other two boilers which were not being tested. Thus the whole test proved itself a farce at once. Then the men told me that this was the way it had been done for years, and that they were instructed to make it in this way.

I had received from the Chief Engineer, on the day before his discharge, the results of the last seven tests, which show an average of 67,043 pounds of water evaporated by 6,286 pounds of lump coal in eight (8) hours, or 10.66 pounds of water by one pound of coal.

On March 2 there were evaporated, according to his figures, 70,800 pounds of water of 170 degrees by 6,250 pounds of best lump coal, or 11.326 pounds

Digitized by Google

of water by one pound of coal. On March 3, in the same manner 64,900 pounds of water of 170 degrees were evaporated by 6,500 pounds of nut coal, or 9.984 pounds of water by one pound of coal. In other words, the evaporation could be brought to any desirable figure by saving coal under the two boilers which were being tested and burning any quantity of coal under the other two boilers, for which the coal was not weighed; or by running off some of the hot water in a suitably located bath tub, which has been done, I am told, as often as the evaporation did not come up to the desired figure.

I then ordered the jackets shut off, or no steam admitted to the jackets on the cylinder heads on the engines. I had the water measured and the coal weighed for the four boilers. Exhaust steam from the pumps was then used for heating the feed water, and live steam from a small steam pipe in place of the exhaust steam from the air compressors, which were now stopped, so as to get the temperature of the feed water to the same height as it had been when used before. The same men who made the tests before made them again, and the length of time was again eight (8) hours. In this way, on March 6, we evaporated with the best lump coal 117,400 pounds of water of 170 degrees with 12,250 pounds of coal; or 9.583 pounds of water by one pound of coal. Accordingly the amount of evaporation by the same kind of coal, of March 2, was given 18.18 per cent. too high.

Digitized by Google

In the same way on March 7, we evaporated with the same kind of nut coal 118,200 pounds of water by 13,000 pounds of nut coal; or 9.092 pounds of water by one pound of nut coal; thus showing the returns of March 3 to have been given 9.8 per cent. too high. For the last seven tests, as given before, the evaporation was likewise found to have been given 11.3 per cent. too high.

I now made another discovery, which reduced still further the claimed evaporative power of the coal. The two measuring tanks were made of cast iron. Each tank had a water gauge glass the whole height, and the tanks were graduated in seventeen equal parts, each part being supposed to contain 100 pounds of water. Consequently, each of the tanks should contain 1,700 pounds of water, from the lowest mark to the highest. On March 9 we filled and emptied the tank several times with hot water from 170 degrees to 175 degrees, so as to get the tanks in their regular condition of temperature, refilled the tanks with water of 170 degrees, and weighed the water accurately on a balanced scale. The weight of water was 1,650 pounds. In other words, the weight had always been given 3⅓ per cent. too high.

Afterwards, on March 13, the tank was filled with cold water and left standing twenty-four (24) hours in order to get the temperature of the room, 70 degrees. The water in the seventeen parts of the tank was then

Digitized by Google

carefully weighed, and it was found to be 1,690.5 pounds, which seems to show that the tanks contain 1,700 pounds of water of about fifty degrees, but not of 170 degrees or more. As a matter of fact, the tanks had been graduated by using cold water.

This mistake reduced still further the claimed evaporation of water by the coal on March 6, from 117,400 pounds to 113,947 pounds, or 9.301 pounds of water by one pound of lump coal. Consequently the returned evaporation of that class of coal was given 21.78 per cent. too high. In the same way the nut coal only evaporated 8.8246 pounds of water, against 9.984 as reported on March 3, which was consequently 13.13 per cent. too high. For the last seven tests as given above, instead of 10 66 pounds, it was actually but 9.301 pounds. In other words, the tests had been reported as 14.6 per cent. too high.

On March 15 we started a twenty-four hours' test, burning good lump coal and using the jacket on the cylinder heads for the first four hours. The total amount of water evaporated in twenty-four hours was 340,648 pounds. To accomplish this evaporation a total of 37,500 pounds of coal was used. During the first four hours 56,585 pounds of water and 6,250 pounds of coal were used, or 9.053 pounds of water for each pound of coal. In the next four hours, the jackets not being used, there was an evaporation of 8.85 pounds of water by one pound of coal. The

Digitized by Google

water used in the jackets in four hours and which was not returned to the boilers, was 1,665 pounds. For the last twenty hours of the test there was an evaporation of 9.12 pounds of water for each pound of coal. The grate under each boiler is 36.336 square feet. The amount of coal burned for each grate in twenty-four hours was 12,500 pounds, or for each square foot of grate, 14.33 pounds per hour. In twenty-four hours the ashes and cinders amounted to 5,215 pounds in 37,500 pounds of coal, or the very high per cent. of 13.1.

According to the coal contract of August 27, 1887, Laurel Hill lump coal was to have evaporated ten pounds of water, and Laurel Hill nut coal nine pounds of water for each pound of coal. The evaporation tests consequently show a decided shortage.

The coal contracts of 1885 and 1886 were so worded as to give the contractor more or less than the contract price, according as the coal he delivered was above or below contract grade. The contract also stipulated that the quantity of water used should be noted for days of twenty-four hours and that the tests should be continued for many consecutive days. By conducting the alleged tests as I have mentioned, the contractors were found to be entitled to an average of twenty-two cents a ton more than contract price. In reality they should have received forty-one cents less than contract price per ton!

Digitized by Google

The same state of things existed at the North Side water works. In brief, I found that from December 3, 1885, to June, 1887, there were paid out $18,128.49 for *extra charges* on this high duty coal. A very remarkable thing was noted here. The same quality of coal which evaporated on August 4, 1885, only 7.84 pounds of water, evaporated on December 20, 1885, 11.94 pounds of water! The contractor had been changed between the times of making the two tests.

At the West Side water works evaporation tests of twenty-four hours duration are made now every month. They have resulted as follows:

For April, 8.232 pounds of water by one pound of nut coal.

For April, 10.058 pounds of water by one pound of lump coal.

For May, 8.25 pounds of water by one pound of nut coal.

For June, 8.88 pounds of water by one pound of lump coal.

For June, 8.36 pounds of water by one pound of nut coal.

For July, 8.805 pounds of water by one pound of nut coal.

For July, 9.075 pounds of water by one pound of lump coal.

For August, 9.54 pounds of water by one pound of lump coal.

Digitized by Google

For August, 9.115 pounds of water by one pound of nut coal.

For September, 10.13 pounds of water by one pound of lump coal.

For October, 10.00 pounds of water by one pound of nut coal.

For December, 10.13 pounds of water by one pound of lump coal.

The engines at the West Side have worked very well this summer. They have pumped more water than ever before in an equal time, and have been kept in good condition. They require close attention, however, to keep them in good working order.

The old engines have elastic rubber bands for valves (Morris' valves) in the pump. They give a great deal of trouble and are expensive, as they often break or tear. They should be replaced by cages with small rubber valves, similar to the ones at the North Side water works.

The new engines have double-beat valves for pump valves, but they are not made correctly. Each pump has a large twenty-four inch diameter suction valve in the center and twelve eight-inch suction valves placed around the large one. To keep the valves from lifting too high, and to make them seat quickly, spiral springs are used. They work all right as long as they are new, but as soon as they lose their elasticity or break, the valves cause an unnecessary thumping noise in the pumps and a trembling of the floor.

Digitized by Google

A few weeks ago one of these large center valves broke the spiral springs and stripped the nut off the bolt which holds the valve. The large valve bell was lifted clear off its guide and was also bent. This required the shutting down of the engine until a new valve was made. In the meantime a general overhauling of the engine was effected. The new valve is a large cage with sixty-six rubber valves of 4⅛ inches diameter, in place of the twenty-four inch double-beat valve. The engine was started again on December 8, and works far better than before. It can now make fourteen revolutions per minute, working at the rate of 20,000,000 gallons each twenty-four (24) hours. It was only built for 15,000,000 gallons.

The large double-beat valves in the pumps, one as suction valve and one as bucket valve, have the immense area of 436.88 square inches for floating. The lower diameters of the valve are 28½ inches and 25½ inches, and the upper diameters are 18¼ inches and sixteen inches.

The weight of the valve complete is 410 pounds in atmosphere, or 368.6 pounds under water. Thus it has 0.843 pounds of weight per square inch of floating area to bring it down to its seat. To accelerate this the four spiral springs are required.

The twelve eight-inch suction valves and the ten eight-inch valves in the bucket are also double-beat valves. The lower diameters are 9⅛ inches and 8¼

Digitized by Google

inches, and the upper diameters are $6\frac{3}{16}$ inches and $5\frac{9}{16}$ inches. Each valve bell with spring weighs $25\frac{3}{4}$ pounds in air, or $23\frac{1}{2}$ pounds under water. Each valve has a lifting area of 19,656 square inches, and a floating area of 41.1 square inches,—or only have a weight of 0.56 pounds per square inch to seat them. These valves work noisily, as soon as the spiral springs are weakened or broken, which is immediately noticed in the working of the pump. All this can easily be overcome by making new valves similar to those now being used at the North Side water works. They can easily be made ready to be placed in the pumps at any convenient time when the engines are being overhauled after their season's work.

The engine house at the West Side water works has been renovated inside; the leaky roof has been repaired; the inside face of the walls has been painted and the engines have been treated with a coat of paint and varnish. The lower floor has been relaid and fastened down, and the rooms whitewashed, so that the whole building looks clean and in order.

At the North Side water works, the same kind of repairing has been going on during the summer. All engines have been repainted and varnished, and the rooms in the building refitted, one of them as an office for the Chief Engineer. The trembling of the building has ceased, and the rooms are habitable.

Digitized by Google

Incandescent electric lights are now used at the North Side pumping station to light the building, stable, and machine shop. Cables are laid to the tower over the new shore inlet, in which electric lights are burning at night as long as navigation is open, and a fog bell is set ringing by an electric motor when fog obstructs the lights. This light is produced by a thirty (30) horse power "Ideal" engine and one Edison dynamo. It was started October 6, 1888.

On November 5 the engines at Fullerton avenue conduit were disabled by the shaft pulling out of the coupling. The pumping of lake water into the North branch of the river was then stopped. To repair the damage the tunnel had to be pumped out, which was a tedious job on account of the gates not closing tightly. A diver had to be employed to remove the obstructions. Afterwards the repairs went on all right and were finished on December 26, when the engine commenced to work again and lake water was again forced into the North branch.

The engines at the Bridgeport canal pumping station again require a thorough overhauling. They should also be improved by extending the shafts through the suction elbows, so as to be able to give them a bearing outside of the wheels. At present the heavy wheels hang on an overhang of the shaft, outside of a single bearing, which, when the bearing has worn down brings a bending strain on the cranks of

Digitized by Google

the engine at every stroke. Through this influence three of the cranks and one of the bed-plates are already broken. When the load of the wheel is distributed over two bearings and the cranks are strengthened the engines will not be exposed to such frequent breaks.

It seems that the whole arrangement to draw the water through one elbow and discharge it through another bend overhead is a very poor device.

I believe that had the whole plant been constructed similarly to the Fullerton avenue conduit, or had the wheel-shafts been placed in line or central with the conduit, better results would have been obtained.

Respectfully submitted.

F. W. GERECKE,
Chief Engineer.

DETAILED REPORT.

CHICAGO, Jan. 20, 1889.

HON. GEORGE B. SWIFT,

Commissioner of Public Works.

DEAR SIR: — I herewith submit to you the Thirty-sixth Annual Report of the North Side water works, ending December 31, 1888.

During January the "'67" double-beam engine was undergoing repairs; the pump barrels were re-bored and the pump pistons fitted to the enlarged bore; the suction and discharge valves, which were at that time in the valve chambers, were repaired, and they worked after that as well as such misconstructed valves could work. The engine was started on February 1, as the quantity of water which the engine could furnish was badly needed at that time. That engine did work in this condition up to August 25, when it was stopped to take out the old double-beat valves and to put new valves of a different construction in their places. The engine was then again started, and it supplied more water than before. This engine was afterwards transferred into a compound engine. It took from October 6 to November 23 to make the change, and it is now running more economically than at any time before.

Digitized by Google

On February 7, the large "'72" double-beam engine had to be stopped, as the rubber valves on the air-pump buckets gave out. The engine then received a general overhauling; new suction and discharge valves being placed in the valve chambers of the pumps, after the old double-beat valves had been removed. This overhauling of the engine was finished on May 29, and the engine has since been running constantly, pumping solid water. Not one cubic inch of air has been required to go into the suction chambers of the pumps or to be forced into the pumps in an artificial way. The air compressors, formerly in use for keeping the valves quiet are still in position, but they are disconnected and have not been in use since the engine was stopped in February. I suppose they will never be used again for this purpose and could be disposed of.

The discharge pipe from the south pump of this engine was cut just outside of the building and a twenty-four-inch branch pipe with the necessary stop valve was laid from this thirty-six-inch main to the twenty-four-inch main leading to Pine street, thus doing away with the unnecessary back pressure in the pipes near the tower where the two thirty-six-inch mains were contracted into one pipe of the same diameter. A twelve-inch pipe from the air chamber on the "'67" engine was also attached to the same pipe below the water line, leading to the delivery pipe

Digitized by Google

of the old "'53" engine inside the building. The discharge pipe from each pump of the "'67" engine is twenty-eight inches in diameter, and after both are connected they have only one outlet of the same diameter. When this "'53" engine is not running, the new twelve-inch pipe relieves the contracted pipe of considerable back pressure.

The "'53" engine also received some attention during the time, from June 26 to August 10. The old brass flopper valves of the buckles and in the suction plates have been removed and new valve plates with small rubber valves substituted. The braces on the column have been supplied with turn buckles so that now tension can be put on the brace rods. These keep the column from rocking, make the engine run quieter than it has for years, and the loud knocking noise of the valves is stopped.

The engine, as it now is, may be used for some years more and can pump more water than ever.

The only engine which has escaped any change is the "'57" beam engine. This engine has been in use only occasionally, having been kept as a reserve. The engine under low pressure works well enough for such an old one.

The new Gaskill engines have worked well, but require very close attention. They were built to do heavier work than to pump against a head of forty

Digitized by Google

pounds pressure and they feel a change of pressure very quickly. The engines work better now than at the commencement of last year.

One of the large boilers in the center boiler house has been removed and sold as scrap. In its place have been put two horizontal tubular boilers of sixty-four inch diameter and eighteen feet length, each boiler containing sixty four-inch tubes. They have been furnished with the Murphy self-stoking furnace to burn soft coal and have been in operation since September 11.

The burning of soft coal in these furnaces has been very successful. When they are in regular operation no smoke is observable coming from the stack. The disagreeable features of burning soft coal are entirely eradicated.

The amount of water pumped at the North Side water works up to May 29 can be given only with great allowances, as up to that time the engines were in the same condition as last year. After that date the supply of water was increased, as then the large "'72" engine commenced to work and added its 32,000,000 gallons of water to the daily supply.

By putting the quantities of water together, on the "'72" engine only one-third of the capacity of the pumps is taken to February 7. Twenty per cent. of loss is also allowed on the "'67" engine up to the time

Digitized by Google

when the new valves were placed in the pumps. After that time, nearly the full volume of the pumps is credited to the supply of water.

The North Side water works main building has been cleaned and painted during the year; all the engines have been painted and varnished, so that the building looks fresh and clean; the rooms have also been repainted and one room up-stairs fitted up as the working room for the Chief Engineer.

Since October 6, the engine building, boiler rooms, machine shops and stable have been lighted by electric incandescent lights, and the same engine and dynamo furnish also lights for the new light-house on the shore inlet tower, 1,500 feet from the shore and furnish power for the fog bell located in the same tower.

Few changes have been made in the personnel of the engineers at the North Side water works. Mr. Henry Welch, as Chief Engineer, has charge of the works; Engineers Farron, Fogg and Van der Hoven attend to the beam engines, and Engineers Kline, Ferris and Knuth to the Gaskill engines.

Attached hereto is a table showing the quantities of water pumped by each engine during each month in the year, and another table showing the expenses connected with the pumping of those quantities during the year.

December	1,432,341,210	966,175,820	1,335,815,400	1,418,069,045	1,535,986,325
TOTALS	16,365,263,090	15,405,650,785	14,004,733,925	16,238,854,625	15,503,534,775

NOTE.—No quantities of water could be given for 1887, as most of the engines were spoiled by the use of air in the pumps, which had been done since 1877–1878. Therefore great allowance should be made even for the quantities given from 1877 to 1886. The figures for these years are not correct. They only show how much water the engines should have furnished—but they did not do it.

Boiler compounds	51 30
Metal polish	30 00
Waste	350 02
Repairing wagon	9 05
Car fare and postage	8 70
Tools	156 88
Books and stationery	57 35
Share of stable expenses	478 75
Total	$123,671 80

TOTAL EXPENDITURES.

Maintenance	$33,487 18
Operating pumping	123,671 80
Water works shops	1,384 48
Total expenditure	$158,543 46

Digitized by Google

Number of gallons of water pumped during the year 1888 at the North Side water works is 15,503,534,775
Cost of pumping $123,671 80
Cost to pump one million gallons $7.97 7-10
Average head against pumps ..... 100 feet
Cost of delivering water per one million gallons, one foot high ..... $ .07 977-1000

This is, as compared with the reports from 1877 to 1886, as printed in the annual report of 1886, the highest cost for pumping one million gallons; but the coal for last year cost $6.27 per ton, the highest price paid in those years. Besides, we are sure that the amount of water has been pumped, as given above, while great allowance must be made on the quantities of water reported to have been pumped in the years from 1878 to 1886, for reasons clearly stated in this report.

The engine and dynamo, which produce the electric lights for the works, have been lately moved and placed on the main floor of the engine house, where they can be more easily cared for than on the lower floor.

Following is a report of the Chief Engineer of the North Side water works, referring to the condition of the shops, stables, tower and grounds.

Respectfully,

F. W. GERECKE,
Chief Engineer.

Digitized by Google

NORTH PUMPING WORKS.

CHICAGO, January 23, 1889.

F. W. GERECKE, Esq.,

Chief Engineer of Water Works System.

DEAR SIR:—I have the honor to submit herewith the Thirty-Sixth Annual Report of these works and the annual report of the Water Works shop and Water Works stable.

COAL AND COMPARATIVE WORK.

During the last year there has been a very noticeable saving in the coal bill as compared with former years. The expenditure for coal for the eleven months ending November 30, 1888, is $67,039.32. To this should be added the December bill, amounting to $7,028.70, making a total for the year of $74,068.02. This alone shows a saving of $10,761.32 in comparison with 1887, when the annual expenditure was $84,829.34. (Twelfth Annual Report, page 375.)

Digitized by Google

In this connection reference is made to the following comparative table of revolutions:

ENGINE.	Revolutions 1887.	Revolutions 1888.	Excess Over 1887.	Less Than 1887.
"1853"	132,005	1,062,505	930,500	.....
"1857"	770,220	1,157,835	387,615	.....
"1867"	3,001,512	2,649,219	.....	352,293
"1872"	4,686,987	3,123,400	.....	1,563,587
Gaskill No. 1	3,746,253	6,731,118	6,820,805	.....
Gaskill No. 2	2,573,555	6,409,495		.....

It will be seen from the table that the Gaskill engines worked more than twice as much as in 1887, as they only ran during the latter part of that year. As the reports of the Chief Engineer of the water works system show that the actual work done by the other engines was much greater than that done by them in 1887, the cost of the coal used in running these Gaskill engines for the extra time should be added to the above, bringing the actual saving for the relative amount of work done to over $20,000.

MACHINERY.

During the year, an electric light plant has been placed in these works. The system is the incandescent kind, under Edison's patents. The entire works, the repair shops and the stable are now lighted by this

Digitized by Google

plant, which also furnishes the light for the lighthouse on the new inlet crib and the power to ring the fog bell on the same.

The old boiler which in many annual returns was reported fit for retirement, has been replaced by two steel tubular boilers which, by direction of the Mayor, were set with the Murphy smokeless furnace.

If, as I would respectfully recommend, six more of these furnaces were substituted for those now in use in the Gaskill boiler room, the boiler capacity would be ample for a long time to come. The cost of this improvement would be but small in comparison with the resulting saving from the use of bituminous coal, which by these furnaces is completely consumed without consequent smoke or soot, as its use for the last four months at these works has fully demonstrated. Indeed, from repeated tests made, the evaporative efficiency of the bituminous coal used under the boilers in these furnaces is shown to be fully equal to that of the best anthracite coal, easily proving that the change to this furnace would result in a saving of one-half in the large bills accruing from the necessary use of such extensive quantities of coal.

The other boilers connected with the old engines are in fair condition, considering their old age and service. The boilers in the Gaskill boiler room have been repaired and are now in good condition.

Digitized by Google

Many and important changes and repairs have been made in the old engines. An enumeration of the more important changes would be as follows:

"'53" engine, old valves and valve seats replaced by new and smaller ones; engine overhauled and frame newly braced.

"'57" engine, large check valve in discharge channel removed; engine overhauled.

"'67" engine, valves in pumps removed and new valves of different pattern substituted; engine compounded and repaired.

"'72" engine, pump valves removed and replaced by smaller ones; engine overhauled.

Gaskill engines, a few necessary repairs made. These engines work in a very satisfactory manner, and are in good condition.

A detailed statement of the repairs made, the reasons for making them and the results obtained, is, I am informed, elsewhere in this report.

WATER WORKS SHOPS.

In July of last year a change in the manner of conducting the shop was deemed desirable, and Mr. Henry Munstermann, a mechanic of known experience and ability, was engaged as foreman.

The result of the methods then introduced has been most satisfactory. Before that time the shops were

Digitized by Google

unable to supply the demand of the water pipe extension for fire hydrants and valves, making it necessary to put in hydrant bottoms, when the water pipe was first laid, and afterwards, to put on the main parts of the hydrant as the shop could supply them. As this extra work cost the city, on an average for each hydrant, the sum of $10, the total expense amounted for a year to a large sum.

Under the new management, it is now unnecessary to expend any of this large sum, as the output not only supplies the demand for finished hydrants and valves, but also permits the accumulation of stock to supply any unusual demand. This result is the more pleasing as the work has been accomplished with but very little change in the working force, and at a comparatively small advance in the annual cost, considering the greatly increased manufacture, the cost of the extra materials used accounting for most of this small advance, as a reference to the following comparisons will readily show:

Cost of new hydrants and repairs, 1887 Annual Report, page 94.....	$27,761 15
Cost of new hydrants and repairs, 1888, Book-keeper's Statement.....	30,502 08
Excess in cost for 1888.....	$ 2,740 93

Digitized by Google

A table showing work done will emphasize the favorable contrast to last year and preceding years.

	Made in 1887.	Made in 1888.	On hand January 1, 1888.	On hand January 1, 1889.
Single hydrant	100	146	None.	8
Two and one-half inch double hydrant	391	607	2	60
Four-inch double hydrant	4	6	None.	None.
Four-inch stop valves	53	65	26	25
Six-inch stop valves	203	282	25	82
Eight-inch stop valves	79	134	3	32
Twelve-inch stop valves	24	23	5	7
Sixteen-inch stop valves	14	2	2	2
Twenty-four inch stop valves	2	1	2	1
Totals	870	1,266	65	217

Part of the machinery in use at the shops is of very old pattern, much limited in capacity and in rather poor condition, requiring constant repairs and necessitating slower work. I would recommend that modern machinery be substituted for this, and if this is done there is no question of the shops, with the present working force, being able to supply the demand made on it, as well by the necessities of all the bureaus of this department as by those of the water pipe extension.

The repairing for the meter department has also been done at these shops. It has been quite extensive and, I am informed, is detailed in the report of

Digitized by Google

that department. A large amount of work was also done for the pumping works in the way of overhauling and repairing machinery.

WATER WORKS STABLE.

The stable, the horses, the wagons and the harnesses are in good condition.

BUILDINGS AND GROUNDS.

Much work has been done on the buildings and grounds during the year.

The asphalt pavement on the drive and sidewalk in front of the works has been wholly repaired; a new sidewalk been built around the works; Tower place paved with wooden blocks; grounds in rear of the works filled in and levelled; the old shore inlet permanently closed up; the overflow sewerage of the Chicago avenue sewer directed from the engine wells; space around sidewalks filled in and grass planted; large shade trees, presented by Mr. J. V. Farwell, set out; a thorough painting given the iron fences, the lawn benches, the flower stands and all outside work; the tower thoroughly cleaned; the walls and inside and outside woodwork repaired and painted.

Most of the woodwork in the water works has been cleaned and painted; two drinking fountains and a toilet room built; the offices of the works thoroughly

Digitized by Google

cleaned and painted and a new office for the Chief Engineer of the Water Works System completely furnished.

Large ventilators have been placed in the new engine rooms, making it more healthful and pleasant for those engaged therein. A new iron platform and steps have been placed between the Gaskill engines rendering their parts more easy of access.

The roof of the new engine house is in bad condition, owing to its faulty construction. It is made of an inner sheet of corrugated iron and an outer sheet of copper, with a composite filling of cinders, ashes, cement etc. The chemical action of the filling in contact with the iron causes the latter to decay, and there is danger of its falling.

EMPLOYES.

The employes of the works, shops and stables have been exceptionally faithful, no serious lapse from duty being noticed at any time in their conduct.

Gratitude is due to the Mayor and Commissioner of Public Works for the kindly treatment and most valuable assistance given to me at all times; an unusual assistance, which has borne fruit in the remarkable improvement of the work done herein and in the much bettered appearance of the grounds, buildings and machinery.

Very respectfully,

HENRY WELCH,
Engineer North Pumping Works.

BRIDGEPORT CANAL PUMPING WORKS.

These works were in continual operation during the year. Several engines had to be stopped for repairs on account of the rapid wearing down of the bearings in which the wheel-shafts rest, causing the cranks of the engines to break.

The driftwood, which sometimes gets through the screens and into the wheels from the river, also caused several stoppages. On account of high water in the Desplaines River the works had to be stopped three days in March and nine days in May. In August the engines were stopped one day to lower the water in the canal in order that a sunken boat might be raised.

During the months of June, July, August and September the works were run to their full capacity.

Annexed hereto is a table showing the work performed and the amount of coal burned at the works; also a table showing the expenses during the year to keep this pumping plant in operation.

F. W. GERECKE,
Chief Engineer.

WEST SIDE WATER WORKS.

The pumping engines at these works have done very good service during the year, having been kept in first-class condition so that they were at any time ready for service. Generally one of the engines was shut down during the night, when the head of water was high enough.

The number of revolutions made by the engines during the year was 20,452,028, being 993,819 more than last year. Consequently the quantity of water

Digitized by Google

pumped was larger, especially when we take into consideration that we are now pumping solid water, and that we do not use the air compressors to force air into the pumps, by which a large percentage of the capacity of the pumps was lost.

The quantity of water pumped at the West Side water works was 21,046,189,980 gallons for the year 1888, while the quantity for last year (1887) was, according to the reports, 20,045,528,000 gallons, an increase of 1,000,661,380 gallons over 1887.

The day of the year when the greatest quantity of water was pumped was June 20, combining both stations. On that day there were pumped at the West Side 61,496,520 gallons, and at the North Side 59,249,330 gallons, making a total of 120,745,850 gallons.

Some of the engines were shut down during the night. Had they been kept going the full twenty-four hours, the volume of water would have been increased on the West Side by 4,230,000 gallons, one engine having been idle six hours and thirty minutes. On the North Side, one pair of Gaskill engines was idle six hours and thirty minutes, and the double north engine nine hours and fifty-five minutes, making a difference there of 7,304,425 gallons. The total would thus have been 132,280,275 gallons instead of 120,745,850 for the twenty-four hours.

During the hours from 8 a. m. to 11 a. m. a greater quantity of water is used than in any other three

Digitized by Google

hours of the day, and the engines consequently run faster. On June 20 they actually did run in those hours as follows :

The four engines at the West Side, 2.85 per cent. above average.

The two Gaskill engines at North Side, 6.5 per cent. above average.

The "'67" beam engine at North Side 0.5 per cent. above average.

The "'72" beam engine at North side 10.0 per cent. above the average, which makes, reducing the speed to gallons pumped, an addition of 618,884 gallons, which is at the rate of 137,180,968 gallons in twenty-four hours.

The two single-beam engines, "'53" and "'57," were not running at that time at the North Side water works.

One of the new engines stripped the nut from the bolt, which holds the large double-beat suction valve in place. The valve bell was thus lifted from its guide and bent so as to destroy it by the bucket striking it. A new nest of valves was substituted, containing sixty-six 4⅛-inch diameter rubber valves. Since they were put into the pumps, the engine runs quicker, the pumps work better and the valves are noiseless.

This change and overhauling of the engine was completed on December 7. It would be advisable to change all the double-beat valves in the same way, as

Digitized by Google

they are not properly constructed. They should work without the spiral springs now used. As soon as the springs break, the valves thump and work very noisily. If the small rubber valves should be adopted on the old engines, which are now working with the Morris rubber bands in the pumps, a material reduction in the cost of repairs on these pumps would be effected.

The inside of the main engine house has been cleaned and painted, the leaky roof has been repaired, the engines have been painted and varnished, the basement has been thoroughly cleaned and the floor relaid and fastened so that the house looks fresh and clean. All this work has been done by the men employed at the water works with the least possible cost. The management of these works has undergone a change for the better since Mr. Commons was placed in charge.

The surroundings of the West Side water works have been somewhat improved at the front on Ashland avenue. The place has been leveled and seeded and the fresh green spot north of the entrance gives a much improved appearance to the place. It is to be hoped that the same plan may be extended to the south side of the entrance and that we can afford to paint the building on the outside.

The personnel of the engineers at these works has undergone a change since last year's report. The

Digitized by Google

COMBINED.

GALLOWS

Digitized by Google

Digitized by Google

former Chief Engineer, Henry Mason, was discharged on March 2, and Robert Commons, one of the engineers, was appointed Chief Engineer on April 13. One of the engineers of the North Side works, Mr. Barnard, took the place of Mr. Commons, and the other engineers—Mr. Stewart and Mr. Sanborn—occupy their former positions. Annexed hereto are the tables of quantities of water pumped during every month in the year by the different engines. Also a table comparing the quantities pumped for the last twelve years and one showing the cost of pumping for the last year.

NOTE.—The use of air-compressors in connection with the pumping engines has been abandoned since March 3, 1888. Since their introduction at the West Side water works up to March, 1888, a reduction of nearly ten per cent., if not more, should be made from the quantities of water reported to be pumped, as the effect of the pumps was spoiled to that amount by using air, under pressure, in the suction side of the pumps.

Digitized by Google

A correction had to be made in the books at the West Side water works. On January 1, '88, an entry was made showing coal on hand in the sheds to be 795 tons, which quantity had decreased on April 15 to 753 tons. The coal was weighed when Mr. Commons took charge and there were on hand only forty-one tons, just one day's supply. This will reduce the quantity of coal on January 1, 1888, to eighty-three tons and this is charged only on the books. Since April 15 the quantity of coal burned and the coal on hand balance with the quantity received.

CITY HALL PLANT.

The machinery in the City Hall building is about the same now that it was at the end of the year 1887, with the exception of a heater being supplied to heat the feed water for the boilers. The steam used in the heater comes from the electric light engines; and this has proved very successful.

The water now goes into the boilers at nearly the boiling point, while before in summer time only cold water was pumped into the boilers. In 1887, during the five months from June 1 to October 31, there were used 1,534 tons of coal. In 1888, during the same time, there were used 1,254 tons of hard coal and forty-two tons of soft coal, making a saving of about $1,423.00 in the five months.

The exhaust pipe of the engines had to be removed from the rotunda and is now running through the air shaft above the roof of the building.

The whole amount of coal used during the year was 4,151 tons of hard coal costing $15,981.35, and 150 tons of soft coal costing $502.50.

The machinery in the City Hall consists now of six boilers, fifty-eight inches in diameter by sixteen feet in length, each having forty-four 4-inch tubes.

Two Worthington pumps for elevators, 16-in. steam cylinders and 12-in. water plungers by 10-in. stroke.

Two Wheeler and Tappan pumps for elevators, 20 x 12½-inch, by 12-inch stroke.

Digitized by Google

Two smaller Worthington pumps, 14 x 7 by 10-inch, and one smaller Worthington pump, 7½-inch and 4½ by 10-inch stroke, and eight elevators, all geared 8 : 1.

Two Crane elevators, cylinders 33-inch diameter by 11-foot stroke.

Four Crane elevators, cylinders 26-inch diameter by 11-foot stroke.

Two Ellithorpe elevators, cylinders 36-inch diameter by 11-foot stroke.

The elevators are usually kept going from 8 A. M. to 5 P. M., and one of them until 10 P. M.

The City Hall plant requires the pumping of a great amount of water.

The pressure is about fifty-six pounds and the quantity is 717,219 gallons per day, but sometimes it runs as high as 800,000 gallons per day.

Very little of this water is wasted, as it is used over and over again. The cost of pumping could be reduced by procuring a larger high pressure compound pump in place of the two Worthington pumps, which will require extensive repairs soon.

The electric plant is driven by two Armington & Sims engines, both running twenty-four hours per day. One of them is 18½-inch by 15 inch, 100 horse power, and the other is 21-inch by 15-inch, 125 horse power.

Digitized by Google

By using the exhaust steam from these engines for heating the building, at least in the Spring and Fall, another considerable saving could be made in the coal bill and the expenses to fit the heating plant would be very small.

F. W. GERECKE,
Chief Engineer.

FULLERTON AVENUE CONDUIT.

The Eighth Annual Report of the operation of these works for the year ending December 31, 1888, is herewith submitted.

The engines are in fair condition and will need no repairs except what may be caused by the regular wear. The engines were overhauled, cylinders re-bored and pistons refitted between March 21 and May 2. At the same time two of the boilers received new flues. The third boiler may have to be fitted up the same way during this year. A wrought-iron pipe coil was placed in the up-take leading to the chimney, for heating the feed water for the boilers, and has given very satisfactory results.

On November 6, the coupling on the east out-board shaft was pulled off on account of the bearing having been worn, and the engines had to be shut down. To get at the wheel and shaft the tunnel had to be pumped out, but the iron gate at the west end could not be closed on account of an accumulation of debris

Digitized by Google

in the gateway. A wooden gate had to be constructed in place of the screen, and a diver was employed to remove all obstructions. The gates were then closed, the tunnel pumped dry and the engine shafts and the bearings repaired.

New composition boxes with lignum vitæ linings were put into the long out-board bearings; the coupling was replaced and the west gate repaired, so that now everything works well. The engine was started again December 26.

Since July 27, the speed of the engine has been reduced from seventy-five to sixty-seven revolutions per minute, as the quantity of water put into the North branch of the river was greater than the engines at Bridgeport could dispose of. Had not this been done the river would have flowed into the lake. At no time during the year was water from the river pumped into the lake at the Fullerton Avenue Station.

On July 26, 1887, a contract was made for a lot of fuel oil to be used with a certain burner, under the condition that 2,250 tons of oil must be equal to 4,000 tons of coal; which would evaporate nine pounds of water with one pound of coal. In other words the price for oil was to be $5.50 per ton; while the coal would be $3.14 per ton.

From September 26, 1886, to February, 1887, there were used 1,502.4 tons of coal in 4,172 5-60 hours to pump 3,808,675,660 gallons of water.

Digitized by Google

The cost of coal was $4,717.53
Consumption of coal per hour.....720.21 pounds.
Water pumped per hour.....912,898 gallons.
Water pumped by one pound of coal.1,267.5 gallons.
Cost of coal per hour $1.13

From September, 1887, to February, 1888, there were used 6,933 barrels and 33¼ gallons of fuel oil in 4,184 30-60 hours to pump 3,863,823,550 gallons of water.

The cost of oil was $5,686.01
Consumption of oil per hour .....494,122 pounds.
Water pumped per hour..... ....923,365 gallons.
Water pumped by one pound of oil.1,868.69 gallons.
Cost of oil per hour.....$1.35
Difference between cost of oil and coal per hour..... 22.78 cents more for oil.
The amount of water pumped with coal to the amount pumped with using oil 1:1.4,743
Price of coal per ton to price of oil.....1:1.7,516
Price paid for oil more than for coal $968.48
Reduced to the same time as using coal $889.34

As the above burning of oil was done for an experiment, the bill presented for payment of oil was for 6,933 barrels, 33¼ gallons of oil, at sixty-seven cents per barrel=$4,645.64, which was paid by the city.

The same engineers as last year are still at the station, Mr. W. I. Turnbull as engineer in charge, and Howell, McCoy and Snyder as assistant engineers. All have been faithful in the discharge of their respective duties.

F. W. GERECKE,

Chief Engineer.

Digitized by Google

CHICAGO, January 2, 1889.

F. W. GERECKE, Esq.,

Chief Engineer of the Water Works System.

DEAR SIR:—The Thirteenth Annual Report of these works ending December 31, 1888, is herewith submitted. When I took charge of the West Side water works on April 13, 1888, I had to investigate the condition of all the engines, boilers and appurtenances coming under my care.

I found the old engines built in 1876 in fair condition; but new rubber valves had to be put in the pumps to get them in working order for the season. These valves, which are of the Morris kind, last only a short time; they stretch at every stroke of the pumps and soon lose their elasticity. They not only break, but they are very expensive and should be replaced by a different kind of valves. The engines had been overhauled about eight months previously, but the metal bases on all pins were brass bound and needed fitting, as they had been badly worn.

The newer engines, built in 1884, had been repaired about eighteen months before, and required some attention, as they could not run through the summer without the risk of a stoppage.

Digitized by Google

New spiral steel springs for the double-beat valves had to be procured. The money for these expenses has been well spent, as these springs have worked much better than the springs formerly used and which were of brass wire.

The engines have been in constant operation and have been subjected to heavy work. On October 30 the large suction valve on engine "'51" was lifted from its fastenings. The spiral springs had broken and the nut was stripped from the end of the bolt which held it in its position. The valve bell was bent and made useless, but luckily no other damage was done. The engine was stopped until December 8. In the meantime the whole engine was overhauled and a new suction valve of a different construction was placed in the pumps, which works so much better than the old double-beat valve that this engine can run faster and quieter than ever before.

After this "'51" engine was in running order, the other one, "'50," was stopped for nine days to fix the brasses around the engine, and to put the steam valves on the engine in order.

The steam jackets on the ends of the cylinders leaked so badly that it was necessary to shut the steam off, and the engines are running now without the use of the jackets.

Since March 3, 1888, the air compressors, which were formerly used in connection with the water

Digitized by Google

pumps, have been idle and only small air valves are used to supply the air chambers with the necessary air. The air compressors could be removed and disposed of, as I do not think they will ever be used again. Since their services were dispensed with, the engines have been working better and the pumps have given more water.

During the summer one of the large gate valves, which closes the pump suction pipe from the well, broke and settled down into the water. A new valve had to be made and it was placed in position, stopping the service of the pump only thirty-six hours.

The steam boilers required much attention. Some of them had new sheets put in their shells; another required a new mud-drum and the feed water coils on three others had to be taken out, as they were used up. They will have to be replaced as soon as we get our machine shops in running order.

We have already a lathe, a planer, a drilling machine and a pipe cutting machine in position. The engine and shafting is in running order and very soon we will be able to do our own repairs.

Some little improvements have been made to abate the smoke from our stack, but it will require more radical resetting of the boilers with modern improvements to consume the smoke.

The building itself and all the engines have been thoroughly cleaned, painted and renovated; the leaky

Digitized by Google

roof has been repaired; the floor in the lower story and over the pump wells has been relaid and fastened down. For all of this only the material was purchased, while the labor has been performed by our men regularly employed around the works and in the pipe yard.

At present the roof is being painted on the inside, and after this is done, the window sash and other wood work on the outside of the building should be painted to preserve them from the influence of the weather.

I also send herewith, copies from the books, giving the detailed work performed by each engine. Their work will compare favorably with the work of former years.

One of our engineers, Mr. Sanborn, has been disabled from service for ten weeks, suffering from a broken arm and many cuts and bruises received by being run over on one of the railroad crossings on his way to these works. At present he is on duty again and he will soon have regained the full use of his injured arm.

Respectfully,

ROBERT COMMONS,

Chief Engineer of West Side Pumping Works.

WATER OFFICE REPORT.

CHICAGO, January 1, 1889.

HON. GEO. B. SWIFT,

Commissioner of Public Works.

DEAR SIR:—I herewith submit my annual report as Superintendent of the Water Department for the fiscal year ending December 31, 1888, showing the income from water collections. I also submit the reports of Thomas Pattison, Assessor, and Henry G. Naper, Chief of Permit and Tapping Sub-department.

The reports above named will be found to contain, in detail, full information concerning the work of those departments during the year just closed.

The growth of the city, the increase in the number of houses and its manufacturing interest is fairly evidenced by the annual increase in the consumption of water and of the revenue of this department.

The balance due on assessments for the year ending May 1, 1889, is $136,963.24 as against $132,041.97 one year since.

I call your attention to the report of H. G. NAPER, of the Permit Department.

Number of ferrules inserted the season of 1888,	11,564
Number of ferrules inserted the season of 1887,	9,438
Increase in 1888 over 1887.....	2,126

The above is a large increase over any previous year.

The total receipts of the Permit Department under Mr. Naper for 1888.....	$38,241 70
Total expenditures, including salaries....	28,222 32
Net gain.....	$10,019 38

I refer you to the report of THOMAS PATTISON, Assessor of Water.

The number of service pipes put in by contract on streets during the year 1888 was 5,387 as against 3,956 for 1887.

Three (3) additional draughtsmen have been added to the Assessor's force during the past year. This became necessary owing to the re-copying of old plat books and to keeping up the increased business caused by new sub-divisions and new buildings erected.

The house to house inspection under charge of W. H. Nickerson, Chief Inspector, began a year ago. It has been continued the past year with satisfactory results. A greater portion of the city proper has been thus canvassed by inspectors, a work which needs to be continued. Seventy-seven thousand, three hundred and eleven houses have been examined during

Digitized by Google

the year. In addition, 12,793 special examinations have been made. Of new pipe traversed, on which buildings are located, there were 123,426 feet.

The duties of inspectors were so thoroughly given in detail in my last annual report, that I deem it unnecessary to do so again. The work has, however, been efficient and well done.

The work of the leak and waste, shut-off and stop-cock forces, under J. C. Folz, Foreman, has been well attended to, as you will see by the following report of their work :

MONTHS.	Bills Delivered.	Shut-off Notices Delivered.	Shut-off for Unpaid Tax.	Notices of Leak and Wastes.	Shut-off for Leak and Wastes.	Complaints Investigated.	Troughs Reported.	Hose Reported.

Digitized by Google

The first and most important question to consider in reviewing the condition of this department is the capacity of the work to furnish at all times an unfailing and abundant supply of water.

In a growing city like ours it may be said the public water works are never finished. No sooner is an improvement or extension completed than the growth of the city requires new extensions, to keep pace with the rapid increase in the consumption of water.

The increase of population is to be provided for, new streets are to be piped, new houses supplied with water and the old houses are constantly being fitted with modern water conveniences. A grave responsibility rests with those who have undertaken to furnish the public with water, for serious consequences would arise if the supply should fail and the city be shut off from water even for a short time.

The water delivered to the city throughout the year has been of excellent quality. There has been no complaint either of its quality or quantity. About August, our pumping works were furnishing such an amount of water that under your instructions orders were issued to the Police Department to permit persons who had paid for the same to use their hose for sprinkling purposes during all hours—not restricting them to the hours between 6 and 7 a. m. and 6 and 8 p. m., as heretofore.

Digitized by Google

Extending the time for discounts, May 1 to 15 and November 1 to 15, to the last day of these months, has proved a great benefit to water tax payers, giving them ample time to avail themselves of discount and in a great measure lessening the crowd at the Water office.

The business of this office during the past years shows conclusively that a readjustment of the water rates should be effected. Equalizing and reducing many charges which are now made regardless of the quantity of the water used, would, no doubt, give much satisfaction to a large number of consumers.

I would recommend that the ordinance governing the uses of water be amended. In my opinion the time has arrived when we could make some reductions and a great many equalizations.

I desire to return my thanks to the heads of the different departments for their uniform kindness and assistance rendered me in the performance of my duties. Also to the employes for the prompt and satisfactory manner in which they have performed their several duties.

Yours respectfully,

T. N. BOND,

Superintendent.

SUMMARY OF FERRULES INSERTED.

	½ inch.	⅝ inch.	¾ inch.	1 inch.	Grand Total.
Driven ferrules	3	1,003	5,018	89	6,113
Screw ferrules	0	3,353	1,975	123	5,451
Grand Total	3	4,356	6,993	212	11,564

Of the above number 1,418 ferrules were inserted as "re-taps" in replaced street mains, 5,387 ferrules for contractors to connect to street improvement water service pipes, and fifty-seven ferrules were inserted in Hyde Park previous to the decision of the Supreme Court.

By deducting 1,418 "re-taps" and fifty-seven ferrules inserted in Hyde Park from the total presented above leaves 10,089 ferrules as the actual increase to the number inserted in previous years.

During the year 1888 there were issued by this department the following number of permits:

For tapping water mains	9,213
For miscellaneous connections	1,900
For moving houses	1,312
Grand Total	12,425

Number of plumbers' licenses issued	286
Number of plumbers' bonds filed	286
Number of leak reports received	439
Number of inspections made by the Plumbing Inspectors	7,679

RECEIPTS.

Amount received for inserting 4,759 ferrules (of all sizes), as per cash book		$14,797 70
Amount credited to Water Fund for 5,387 ¾-inch ferrules inserted for street improvement water service pipes, and deducted from contractors' bills @ $3.50		18,854 50

For 1,418 "re-taps" inserted in replaced street mains, as follows:

1,083 ⅝-inch ferrules @ $3.00	$3,249 00	
315 ¾-inch ferrules @ 3.50	1,102 50	
20 1-inch ferrules @ 5.40	108 00	
Total	$4,459 50	
Less fifty-two of the above, for which a bill was sent to the West Chicago Street Railroad Company	156 00	
		4,303 50

We have on hand six Mueller screw tapping machines and six tapping machines of the old pattern for driving ferrules.

In my report for 1887 I suggested that the driving or smooth-bore ferrules then on hand be used only for re-tapping in replaced street mains, and the insertion of screw ferrules only for all other applications for service pipes. This it was found impossible to put into practice to the extent desired, owing to the letting of an unprecedented number of contracts by the Commissioner of Public Works for laying down water service pipes on streets to be improved. You will notice that the total number of ferrules inserted for water service pipes let by contract alone amounted to 5,387 — exceeding the work for any previous year during the history of Chicago. Said contracts were divided among six different contractors, and as each had but a limited time in which to complete his work during last summer and fall, the demand became so great, that, even after adding four new Mueller screw tapping machines and employing three additional tappers, we found it impossible to insert ferrules as fast as wanted without dividing the force of tappers and resorting to the more expeditious method of tapping with smooth-bore or driven ferrules.

For nearly all applicants for water supply to new buildings, and for buildings in new pipe districts, screw ferrules were inserted. Respectfully submitted.

HENRY G. NAPER,
Permit Clerk Water Office.

ASSESSOR'S SUB-DEPARTMENT.

CHICAGO, January 12, 1889.

HON. GEORGE B. SWIFT,
Commissioner of Public Works.

DEAR SIR :—I have the honor to submit to you my annual report, for the year ending December 31, 1888. It shows :

I. The amount of assessments for water rates on books on January 1, 1888, with the increases and decreases up to April 30, 1888.

II. The amount as assessed and on books May 1, 1888 for the water tax year to May 1, 1889.

III. Increases and decreases up to December 31, 1888.

IV. The amount of miscellaneous assessments during the same period. This arrangement is necessary from the fact that the municipal fiscal year ends December 31, while the water tax year is from May 1 to April 30.

V. A detailed statement of the water service pipes put in by contract.

VI. Estimates of assessments for water service pipes on the several streets ordered for improvement

NOTE.—In the cases of streets requiring only a few pipes and marked "Not assessed," the owners will be notified to put in whatever water service pipes they may require, before the streets are paved.

Permit me to call your attention to the necessity of changing our present mode of arranging the division books from ward boundaries to additions and subdivisions by sections, as in the State and County

Digitized by Google

tax books, thus enabling us to have full additions or subdivisions in the same book, instead of a few blocks in one book and a few in another, as we have now.

For example, according to our present arrangements: original town is so cut up that we have blocks 1 to 4 in the Twenty-fourth Ward; blocks 5, 6, 7, 14 and 15 in the Twenty-third Ward; blocks 16 to 21, 31 to 43, 52 to 57, and wharfing lots 1 to 31 in the First Ward; blocks 8 to 13, 22 to 25, 59 to 64 and J and K in the Seventeenth Ward, and the balance, blocks 26 to 29, 44 to 51 and N and O in the Eighteenth Ward.

Thus we have original town scattered through five different ledgers, when it could all be in one book if the four water districts of the city were divided by section lines instead of ward lines, as at present. Take Newberry's addition, being a part of the W. ½ of the N. E. ¼ of Sec. 9, 39, 14, and we have blocks 1 to 9 in the Twenty-fourth Ward and 10 to 18 in the Twenty-third Ward. It should be all in one book. In C. T. subdivision of Sec. 33, 39, 14, we have blocks 1 and 2 in the Third Ward; 3 to 8 in the Fifth Ward; blocks 13 to 20 and 29 to 32 in the Fourth Ward; blocks 9 to 12 and 21 to 28 in the Sixth Ward, being now in four books instead of one. In Assessor's division of E. ½ of S. E. ¼ of Sec. 18, 39, 14, we have blocks 1 and 2 in the Eleventh Ward; blocks 3, 4 and 5 in the Twelfth Ward, and blocks 6 to 17 in the Ninth Ward; or Ashland's first addition, being the S. E. ¼ of the N. E.

Digitized by Google

¼ of Sec. 18, 39, 14, and we find blocks 5 to 8, 13 and 14 in the Eleventh Ward, and blocks 1 to 4 and 9 to 12 in the Twelfth Ward; and so on all over the city, thus giving us double the work to keep our examination books and records on file, so that they can be readily found for reference when needed for explanations which we are constantly required to give to the water takers when paying their bills. The division clerks would also find it much more convenient to have all the blocks of any subdivision in one book instead of two, three or four, as at present.

The four districts might be arranged as follows:

First district, all east of Halsted street and south of Madison street.

Second district, all north of Madison street and east of Halsted street and north branch of Chicago river.

Third district, all west of Halsted street and south of Madison street.

Fourth district, all west of Halsted street and north branch of Chicago river and north of Madison street.

During the past year eight volumes of our plat books and five volumes of city atlases have been rebound, and are now in much better condition than they were a year ago. So far as the time will permit after the regular routine work is done, the new plat books are being filled up as rapidly as possible, and

Digitized by Google

many of the old ones are having the titles neatly written permanently in ink where they have been in pencil and nearly illegible.

For the details of the work in getting up the estimates for special assessments, the contracts for water service pipes and for the work done on annual examinations etc., I will respectfully refer you to my last annual report.

Respectfully submitted,

THOMAS PATTISON,

Water Rate Assessor.

BUREAU OF SEWERS.

CHICAGO, January 21, 1889.

HON. GEORGE B. SWIFT,

Commissioner of Public Works.

DEAR SIR:—I herewith transmit for your consideration the annual report of the Bureau of Sewers for the year ending December 31, 1888, showing, in tabulated form, the work accomplished and the cost of same.

Following is the amount of money expended in the several branches of this Bureau during the past year:

For building new sewers and catch-basins	$228,567 57
For repairing sewers and catch-basins	8,722 38
For cleaning sewers and catch-basins	52,422 41
For street intersections	45,060 59
For house drains	28,047 29
For salaries	17,002 00
For office expenses	1,069 00
Total	$380,891 24

Digitized by Google

For detailed statement of work accomplished, please see following tables:

STATEMENT SHOWING THE VALUE OF THE MATERIAL AND STOCK ON HAND AND THE UNEXPENDED BALANCE STANDING TO THE CREDIT OF THE SEWERAGE FUND, JANUARY 1, 1889:

Wooden covers and lumber	$ 6,160 00
Iron covers	5,162 45
Sewer pipe	2,780 34
Brick	318 50
Sand	110 00
Cement	185 00
Stock (machinery, tools etc.)	5,500 00
Unexpended balance	38,208 54
Of this amount there is due private parties holding certificates for money advanced to construct sewers	13,680 00

During the year, in addition to the extension of the general system, the sewer in Central Park avenue has been built from Ogden avenue to Madison street, and in Madison street from Central Park avenue to Crawford avenue. This completes the sewer in Madison street from the lake to the city limits. The Milwaukee avenue sewer has been built from Western avenue to Fullerton avenue. This also completes the Milwaukee avenue sewer to the city limits. The Armitage avenue main sewer has been extended to the east line of Humboldt Park boulevard at Augusta street this year, and should be continued west as rapidly as the city's finances will permit, as the territory lying between Kedzie and Crawford avenues and Kinzie street and North avenue is building up very rapidly, and there is no way of draining this district until this main sewer is extended.

Digitized by Google

A large portion of that part of the Sixth Ward west of Ashland boulevard is yet unsewered, and quite compactly built up in many blocks. Nearly every lot is built upon, and there is no way of disposing of the sewerage except by running it into the street gutters, which, in most cases, have little, if any fall. This district should get its full share of sewers built from the next appropriation.

In closing this report, allow me to acknowledge my obligations for the courtesy and co-operation of the Commissioner and officers of other bureaus of this Department, and to the efficiency and faithfulness of the employes of this bureau.

Respectfully submitted,

O. H. CHENEY,

Superintendent Sewers.

BUREAU OF STREETS.

CHICAGO, December 31, 1888.

HON. GEO. B. SWIFT,

Commissioner of Public Works.

DEAR SIR:—I have the honor to submit herewith, the Thirteenth Annual Report of the Bureau of Streets, for the year ending December 31, 1888.

It embraces in detail a review of the work accomplished during the year, under the supervision of this bureau; also street railway extensions, and a complete list of streets occupied by railway tracks in the several divisions of the city, operated and controlled by the different horse and cable railway companies.

The improvement of streets from 1835, and the first pavement laid in 1855 to date, alphabetically arranged, is also embraced herein.

The following tables show the progress made in Street and Alley improvements, the character of pavement laid on each street, the total length in lineal feet and miles, as well as surface measurement in square yards.

REPAVING.

The amount of repaving done by the division foremen in the work of repairing improved streets, the replacing of pavement where openings were made by gas companies, water and sewerage departments etc., and on account of street permits and general repairs, is given in the following; also the amount of repaving done by contractors for gas companies etc., the work having been done under this department's supervision and the expense of same paid by the companies interested:

FOR WHAT PURPOSE.	North Div.	South Div.	West Div.	Total.
	Square Yds.	Square Yds.	Square Yds.	Square Yds.
General Repairs	6,748	17,353	25,159	49,260
Gas Companies	170	926	4,444	5,540
Water Department	622	756	2,334	3,712
Sewer Department	167	403	946	1,516
Fire Department	90	20	515	625
Engineer's Department	100	90	24	214
Street Permits	3,296	3,331	13,157	19,784
Totals	11,193	22,879	46,579	80,651

Total number of square yards	80,651
To which is added the amount of repaving done by contractors for Gas Companies etc	16,634
Grand total square yards	97,285

UNIMPROVED STREETS.

In the work of grading and ditching, the money at the disposal of this department for that purpose has been judiciously expended in keeping unimproved streets in good, passable condition.

The total length of streets graded and ditched by the division foremen amounts in the aggregate to about 291 miles, an increase of over fourteen per cent. over last year.

The following streets were planked, all of the material used being furnished by property owners in the localities mentioned:

Paulina, between Blue Island avenue and river	2,000 feet
Ullman, between Thirty-fifth and Thirty-eighth	1,500 feet
Thirty-eighth court from Halsted to Laurel	1,280 feet
Harrison, from Clark to Rock Island R'y tracks	400 feet
Polk, from Clark to Pacific avenue	215 feet
Polk, from Sherman to Fifth avenue	215 feet
Sherman, from Polk to Harrison	800 feet
Throop, from Twenty-second to South branch river	1,680 feet
Alley west of Blue Island avenue between Gurley and Harrison	470 feet
Canal, between Eighteenth and Twenty-second street bridge	3,000 feet
Total	11,560 feet

IMPROVED STREETS.

STREET SWEEPING AND CLEANING.

Previous to this year the work of street cleaning has been done entirely by contract. Under your instructions this method was changed by placing the First Ward in a district to be cleaned by this department; all improved streets outside of said district to be let on contract to the lowest bidder to sweep those streets with machinery, and collect and remove all sweepings.

The streets were scheduled for cleaning as follows:

CLASS A—107,445 lineal feet or 20.35 lineal miles.
CLASS B— 63,028 lineal feet or 11.93 lineal miles.
CLASS C—254,393 lineal feet or 48.18 lineal miles.
CLASS D—275,398 lineal feet or 52.16 lineal miles.
CLASS E—579,160 lineal feet or 109.69 lineal miles.
CLASS A—Comprises the streets in the First Ward only.
CLASS B—Streets cleaned twice each week.
CLASS C—Streets cleaned once each week.
CLASS D—Streets cleaned twice each month.
CLASS E—Streets cleaned once each month or as often as required.
CLASS F—Alleys cleaned once each month, with the exception of those in the First Ward which were cleaned more frequently.

The contract for sweeping with machinery the improved streets in the First Ward, was awarded to John S. Cooper, at $7 per lineal mile.

Digitized by Google

The contract for sweeping and cleaning all improved streets outside of the First Ward, was also awarded to John S. Cooper, the contract price per lineal mile being $23.99.

The work of cleaning was commenced on April 2, 1888, and closed December 31, 1888.

Total cost of the work under contracts	$88,168.41
Cost of cleaning done by the Department	56,392.09
Total amount expended during the year for street cleaning	$144,560.50

The following tables show in detail the amount, character and cost of the work of cleaning improved streets during the year 1888:

Work closed in Classes B, C, D, E and F, Nov. 17, 1888.

Average number cubic yards removed each month, 14,505.

Digitized by Google

The district scheduled as Class A, is composed of streets in the First Ward which were swept with four-horse machines, under contract with John S. Cooper, at $7.00 per lineal mile. The work of collection and removal of sweepings was performed by laborers at $1.50 per day, and carts at $3.00 per day.

One item in this connection should not be overlooked; the Baltimore & Ohio Railroad Company received all the sweepings from this district, an average of four car-loads daily, and removed the same beyond the limits of the city, without charge.

The following table shows sweeping done with machinery, by the contractor, for Class A during the year:

Months, 1888.	Sweeping Done.		Cost at Contract Price.
	Lineal Feet.	Lineal Miles.	
April	901,689	170.77	$1,195 39
May	1,416,769	268.33	1,878 31
June	1,805,823	342.02	2,394 14

Contract for sweeping Class A closed December 31, 1888.

Average number of lineal miles swept each month 237 57
Average cost for sweeping each month $1,662 97

Digitized by Google

The work of street cleaning in the First Ward, as performed by the department during the year, has been more thorough than that of any previous year, and the average cost, per lineal mile, much less as the following table shows.

This district was divided into two parts; that portion from and including Twelfth street north to Van Buren street was cleaned twice each week; that from and including Van Buren street north was cleaned four times each week.

The sweeping was done at night, and the work of collection and removal commenced at 5 A. M. until September 18, when the carts and broomers were sent to work at 10 P. M., immediately following the sweeping machines, finishing on or before 7 A. M.

REMOVAL OF SNOW, ICE ETC.

During the months of January, February and March, all the street intersections within the First Ward north from Van Buren street, inclusive, were swept and cleaned by the department daily, removing snow, ice and dirt therefrom.

Also sweeping and cleaning all bridges, viaducts and approaches thereto, also opening gutters and inlets to catch-basins within the same district.

Total number of intersections cleaned	94
Total number of bridges cleaned	9
Total number of viaducts cleaned	8

During the month of March, in addition to the above, seventy-five lineal miles of streets and four lineal miles of alleys were cleaned from curb to curb, in the three divisions of the city. These included principally main streets adjoining and extending from the central part of the city.

Total cost for the month of January	$5,051 45
Total cost for the month of February	5,282 30
Total cost for the month of March	4,606 65
Total cost for three months	$14,940 40

In addition to the foregoing, 129.27 miles of macadam paved streets were scraped and cleaned by district foremen of the department.

PERMITS FOR OPENING STREETS.

Fifteen hundred and fifty-two (1,552) permits were issued to sundry persons to open improved streets. A cash deposit, covering cost of replacing pavements etc., to their original condition, was made on each permit.

Openings made on improved streets by gas companies and sundry other corporations under general deposit, where the work of replacing pavements was done by contractors, subject to inspection and acceptance of the department, are not included herein.

HOUSE MOVING.

Forty-six licenses were issued to house movers during the year. Thirteen hundred and thirteen (1,313) permits to move buildings were granted, of which 1,207 were for frame buildings, ninety-nine for brick, and seven for wire cable frames and reels, the total frontage of which is 26,131 lineal feet. The increase in the number of buildings moved during the year was 40½ per cent. Of this number, 210 were in the North division, 304 in the South division and 799 in the West division; 673 were one story, 610 two stories, 29 three stories, and one four stories high. Total cash receipts, $3,676, of which $2,930 were for $5.00 permits, $726 for $1.00 permits, and $20.00 for fines. The following table shows the number and character of the buildings moved each month, and the receipts from this source, apportioned by divisions:

SIDEWALKS.

The number of miles of sidewalks rebuilt during the year, including wood, stone and concrete, also miles of sidewalks, repaired, is shown in the following table:

DIVISION.	MATERIAL.			Total Miles.	Sidewalks Repaired.	Grand Total Miles.
	Wood.	Stone.	Concrete.			
North	17.85	2.30	.23	20.38	8.50	28.88
South	23.36	8.79	.18	27.33	20.76	48.09
West	92.42	6.85	.25	99.52	99.47	198.99
TOTAL	133.63	12.94	.66	147.23	123.73	270.96

In addition to the above there has been built 37.13 miles of sidewalk on ground not heretofore covered, distributed as follows:

North Division..... .51 miles.
South Division..... 5.40 miles.
West Division.....31.22 miles.

This makes a total of 308.09 miles of sidewalk built, rebuilt and repaired, during the year. Included in the above is 19.64 miles of wooden walks built by the city, under special assessment.

Digitized by Google

The total number of miles of sidewalks under the control of the city and the West, South and Lincoln Park Commissioners at the close of the year, is given in the following summary:

UNDER CONTROL OF	MATERIAL.			TOTAL MILES.
	Wood. Miles.	Stone. Miles.	Concrete. Miles.	
City	1,028.72	99.55	16.34	1,144.61
South Park Commissioners	.....	9.79	.....	9.79
West Park Commissioners	.....	10.63	.....	10.63
Lincoln Park Commissioners	.....	1.75	.....	1.75
	1,028.72	121.72	16.34	1,166.78
Wood Sidewalk replaced by stone and concrete				5.67
Total miles in city				1,161.11

During the year the department constructed stone sidewalks as follows:

On St. Clair street, from Ohio street to Superior street,
On Twenty-second street, from State street to Indiana avenue,
On Forest avenue, from Thirty-first street to Douglas avenue,

for which a special assessment was levied, the work being done under contract.

CHICAGO, December 31, 1888.

MR. GEORGE W. DEAL,

Superintendent of Streets.

DEAR SIR:—I herewith present my Annual Report of Street Lamps for the year 1888. At the close of the year there were, including those on bridges, viaducts, parks and boulevards, 19,604 gas lamps and 5,474 oil lamps in the city, as follows:

GAS LAMPS.

DIVISION.	No. in City January 1, 1888.	No. Erected during year 1888.	Total.
West	10,002	1,499	11,501
South	4,602	368	4,970
North	2,924	209	3,133
Total	17,528	2,076	19,604

OIL LAMPS.

DIVISION.	Number in City January 1, 1888.	Number erected during year 1888.	Total.	Less number discontinued where Gas mains have been laid during year 1888.	Total.
West	2,201	1,831	4,032	507	3,525
South	1,214	294	1,508	130	1,378
North	603	59	662	91	571
Total	4,018	2,184	6,202	728	5,474

Digitized by Google

The following statement shows the number of gas lamps in the city at the commencement and close of each year, from the organization of the Department of Public Works in 1876 to date:

YEAR.	WEST DIVISION.			SOUTH DIVISION.			NORTH DIVISION.

1888.....	2,201	1,324	3,525	1,214	164	1,378	603	less 32	571

Total number added during the past seven years:

West Division	3,268
South Division	1,281
North Division	351
Total	4,900
Total number of oil lamps in city January 1, 1881	574
Total number of oil lamps in city December 31, 1888	5,474

The number of lamps glazed to replace broken glass was 62,207, of which 33,269 were in the West Division and 28,938 in the South and North Divisions. The average per day was about ninety-one in the West Division and seventy-one in the North and South Divisions combined.

Digitized by Google

Five hundred and eighteen old lamps were repaired and painted. 1,689 new plain lamps and 1,039 corner or sign lamps were made. The number of lamps made for new lamp posts erected during the year was 2,076. Two thousand and fifty-nine boxes of glass were used in old and new work. A considerable amount of work was also done during the year for the bridge and street bureaus. For other items, see Commissioner's Report under head of Street Lamps.

Respectfully submitted,

JOHN STEWART,
Superintendent of Street Lamps.

The total number of miles of pavement laid each year, from the introduction of street paving in 1855 to the present date, is given in the following review:

Year.	Number of Miles.	Year.	Number of Miles.	Year.	Number of Miles.
1855	1.72	1867	11.37	1879	6.83
1856	.26	1868	5.46	1880	16.84
1857	2.62	1869	18.32	1881	24.52
1858	7.20	1870	19.96	1882	24.95
1859	5.70	1871	25.63	1883	22.49
1860	.....	1872	1.82	1884	34.52
1861	.69	1873	10.19	1885	38.06
1862	2.57	1874	9.07	1886	43.66
1863	2.00	1875	11.49	1887	36.75
1864	2.40	1876	10.50	1888	54.33
1865	2.03	1877	12 29		
1866	8.87	1878	11.01	Total No. of miles	486.12

NOTE.—Of this amount 137.59 miles have been repaved during the same period, which reduces the actual amount of improved Streets within the corporate limits at this date to 348.53 miles.

Respectfully submitted.

GEO. W. DEAL,

Superintendent of Streets.

REPORT

OF THE

Telegraph Department

CITY OF CHICAGO.

Digitized by Google

Digitized by Google

CITY TELEGRAPH DEPARTMENT.

CHICAGO, December 31, 1888.

GEO. B. SWIFT, Esq.,

Commissioner of Public Works.

DEAR SIR:—The electric light plant which was installed at the corner of Washington and Clinton streets, at the close of the preceding year, to light the river, bridges and viaducts, was duly completed, and has been in continuous operation since. Several changes in the plant connections and lights have been caused by the reconstruction of bridges and viaducts. Notwithstanding which, the plant has given entire satisfaction.

Encouraged by the above experiment, it was decided to install a street lighting plant which has just been completed. The power station is located at 195 South Jefferson street, in the quarters formerly occupied by Hook and Ladder Company No. 2, and is equipped with one 400-horse power engine, four boilers with Murphy furnaces attached, eight 30-light dynamos of the Western Electric pattern, and one sixteen circuit

Digitized by Google

switchboard with latest improvements. The interior is wired in a manner conducive to the best results.

One hundred and seventy-nine street lamp posts of very neat design, each with 2,000 candle power double carbon arc lamp attached, were placed on the following streets:

Five on West Washington street, from Canal to Clinton streets; five on East Washington street, from Market street to Fifth avenue; sixty on West Madison street, from river to Ashland boulevard; twenty-four on East Madison street, from river to Michigan avenue; six on East Van Buren street, from Fifth avenue to river; eleven on West Van Buren street, from river to Halsted street; six on La Salle street, from Adams to Washington street; twenty-five on Michigan avenue, from river to Jackson street; twelve on Desplaines street, from Van Buren to Randolph street; twelve on Halsted street, from Van Buren to Madison street; four on East Randolph street, from Market to Franklin street; three on Ashland avenue, from Ogden avenue to Washington boulevard; three on Fifth avenue, from Van Buren to Washington street; one on the east side of Dearborn street, between Madison and Monroe streets; one on the east side of Franklin street, between Randolph and Washington streets; one in front of power station. Total 179. Three of above are placed in engine houses, and one in the power station.

Digitized by Google

Thirty-five miles of cable of high insulation and conductivity were laid underground, and 24½ miles of substantial conduits, which include fifty-three manhole chambers and 108 hand-holes.

Power was applied to the plant December 24, and the rays o 358,000 candle power were substituted for 9,120 candle power furnished by gas lights displaced.

Tota number of lamps placed on streets...	175
Total number of lamps placed on river.....	104
Grand total.....	279

Number of lamps placed on river where no gas displaced.....	29
Number electric lights placed, displacing gas	250
Total number of gas lamps displaced.....	799
Candle power of 799 gas lamps, 16 C. P. each,	12,784
Candle power of 250 arc lamps, 2,000 C. P. each.....	500,000

One arc lamp displaces 3 $\frac{8}{10}$ gas lamps.

The displacement of gas lights because of electric lights confined to trunk lines, is not as great as it would be if a section o one mile was lighted, permitting the rays of one light to intermingle with another. I am more than satisfied that the displacement of gas lights by the systematic placing of arc lights would be one arc light to five gas lights.

Digitized by Google

The introduction of the system was highly satisfactory and beyond expectation. The work of transferring the river plant and connecting it with the new station is now in progress and will be soon completed, so that the power for both plants will be supplied from one station.

November 1, an incandescent electric light plant of 240 light capacity was installed in the North Side water works. One hundred and seventy-eight 16-candle power lamps were distributed in the works; a cable was placed in the tunnel and the lighthouse on the new shore inlet, about 700 feet from the shore at the foot of Pearson street, connected with plant and furnished with twenty-four 32-candle power lamps, placed in circular form in the cupola, with reflectors. A 700-pound fog bell was also placed on the lighthouse and operated by one 4-horse power electric motor, which is set to strike eight blows per minute. The light can be seen for a distance of ten miles.

The arrangement for controlling the light and the fog bell is a very simple and novel device. In front of the dynamo two switches are placed, one for the light and one for the fog bell motor. They can be worked individually or together.

This, I believe, is the first instance of incandescent light being employed in lighthouse or for fog bell motor. The plant, as installed, gives entire satisfaction.

Respectfully submitted,

J. P. BARRETT,
Superintendent.

*NOTE.—The following statement shows the amount of estimates issued during the year 1888, in the construction of new viaducts and bridges, paid (or payable) by sundry railroad companies, directly to contractors, and therefore not appearing as receipts and expenditures on the books of the Department of Public Works, the Comptroller's and Treasurer's. In this connection I would suggest the advisability of stipulating in future agreements that corporations who pay part or all of the cost of public improvements be held to make their payments to the *City* instead of to the *contractor* (whose contract is with the City of Chicago), so that the entire cost of the improvement may be properly and completely shown on the books mentioned.

LOCATION OF VIADUCT OR BRIDGE.	NAME OF CONTRACTOR.	NAME OF RAILROAD CO.	AMOUNT.	
Ashland avenue viaduct	Wm. F. Hair	C., St. L. & P. R. R. Co	$8,452 18	
Ashland avenue viaduct	Same	C. & N.-W. R'y Co	3,811 00	
Ashland avenue viaduct	Same	C., M. & St. P. R'y Co	8,452 18
