#### **DESCRIPTION:**

#### **Describe Setting:**

Bridge 11007 carries US 40 Alternate over the Casselman River. Located east of Grantsville, Maryland, the bridge is located several hundred feet south of its famous predecessor, the stone-arch Casselman Bridge on the National Road. The bridge carries US 40 Alternate in a generally east/west direction, while the river flows in a south/north direction. The area is relatively undeveloped, although a small craft market and motel are located on the east approach.

#### **Describe Superstructure and Substructure:**

This structure is a skewed single-span Pratt through truss. The truss is comprised of seven panels measuring 19'-0" each and has a total length of 133'-0". The clear roadway width is approximately 14 feet. The top chord is constructed from back to back channels, a riveted cover plate on top, and lattice on the bottom. The bottom chord consists of double channels face to face. All diagonal and vertical members are I-shaped members. The deck is supported by floorbeams attached to the I-shaped vertical members. The floor system consists of built-up transverse floorbeams and I-shaped longitudinal stringers. The portal bracing is also comprised of riveted I-shaped members. All joint and member connections use gusset plates with rivets. The deck consists of a concrete deck slab supported by the longitudinal I-shaped stringers and asphalt overlay has been added to the top surface of the concrete deck. The guardrails consist of two shapes with a round steel pipe on the top and a W-shaped steel rail on the bottom. The rail is supported by attachments to the truss members as well as additional vertical supports attached to the bottom chord of the trusses. The substructure consists of two cantilever concrete abutments with concrete wingwalls.

#### **Discuss Major Alterations:**

The only apparent alteration to the bridge is the replacement of the original channel bridge railing with new W-beam guiderails.

#### **HISTORY:**

WHEN was bridge built (actual date or date range) 1932  This date is: Actual X Estimated County bridge files/inspection form Other (specify) SHA bridge inspection files; State inventory form				
WHY was bridge built? To provide a reliable crossing of US 40 over the Casselman River, to meet local and regional transportation needs.				
WHO was the designer				
WHO was the builder				
WHY was bridge altered? [check N/A X if not applicable]				
Was bridge built as part of organized bridge-building campaign? Yes X No This bridge was built under the aegis of the State Roads Commission as part of the Good Roads Movement, in connection with the 1930s construction of route 40				

G-11-C-101

#### **SURVEYOR/HISTORIAN ANALYSIS:**

This bridge may have National Register significance for its association with: A - Events X B- Person C- Engineering/architectural character X Was bridge constructed in response to significant events in Maryland or local history? No\_Yes\_X If yes, what event? This bridge was one of a small but significant number of metal truss bridges erected in Maryland from the 1920s through the 1940s. Its heavy, solid construction reflects continuing advances in metal truss technology and fabrication early in the century, and the almost unyielding reliability of substantial trusses for major crossings. Such bridges were built throughout the state during the period, particularly in the early 1930s, as part of the Good Roads Movement promoted by the State Roads Commission. When the bridge was built and/or given a major alteration, did it have a significant impact on the growth & development of the area? No  $\underline{\hspace{1cm}}$  Yes  $\underline{\hspace{1cm}}$  X Because of their solidity and reliability, metal truss bridges with heavy members such as this bridge were often utilized in Maryland from the 1920s through the 1940s at long crossings, and on major highways, like route 40. Multi-lane facilities carrying major thoroughfares, they had not only a significant impact on local growth, but facilitated regional residential, commercial, agricultural, and industrial development. Is the bridge located in an area which may be eligible for historic designation? No X Yes Would the bridge add to \_\_\_\_or detract from \_\_\_\_historic & visual character of the possible Is the bridge a significant example of its type? No Yes X Between 1840 and the Civil War, under the impetus of a rapidly expanding railroad system, the majority of early American metal truss bridge forms were patented and introduced. In Maryland, the earliest

metal truss bridges carried rail lines, which required their great strength and reliability. From the War through the end of the century, metal truss technology was improved, steel began to replace iron, and the use of trusses was expanded to carry roads as well as rail lines.

Numerous metal truss bridges were erected in Baltimore, the original hub of the metal truss in the state, from the 1850s through the 1880s. From Baltimore, the use of the metal truss spread out to other parts of the state, particularly the Piedmont and Appalachian Plateau. Many bridge and iron works were established in the eastern United States to design and fabricate truss members, which were then shipped to sites in Maryland and elsewhere to be erected. More than 15 different bridge companies located in Maryland, Ohio, Pennsylvania, New York, Virginia, and Indiana are known to have shipped metal truss bridges to sites throughout Maryland. Bridges were first fabricated in Maryland, and shipped to sites within the state and beyond, by the companies of seminal bridge designer Wendel Bollman.

Early in the twentieth century, concrete bridges began to compete with metal truss bridges throughout the state at small to moderate crossings. With the development of uniform standards for concrete bridges by the State Roads Commission in the 1910s, the construction of smaller metal truss bridges significantly declined throughout the state. The metal truss still remained the bridge of choice for large crossings, however. In the 1920s, heavier members began to be used at these bridges. Reflecting even heavier load requirements and increased lengths, metal truss bridges erected in the state in the 1930s and 1940s were heavy and solid, rather than light and delicate like their late-nineteenth- and early-twentieth-century predecessors.

Numerous Pratt truss bridges were erected throughout the country between 1844, when the type was patented by Thomas and Caleb Pratt, and the early twentieth century. The Pratt has diagonals extended across one panel in tension and verticals in compression, except for hip verticals immediately adjacent to the inclined end posts of the bridge. The large majority of Maryland's surviving metal truss bridges are Pratts, built as through or pony trusses either riveted or pin-connected.

This bridge was erected during one of the three key periods (1840-1860, 1860-1900, and 1900-1960) of bridge construction in Maryland. Built in 1932, it falls within the period 1900-1960. During this era, metal truss highway bridges became increasingly standardized. Also during this period, smaller and moderate length trusses were gradually replaced by reinforced concrete structures, and the modern metal girder bridge, which could easily be widened, replaced the metal truss bridge at all but the largest approaches and crossings. Built after 1930, it is characterized by heavy solid members, rather than the relatively delicate members that characterized its late-nineteenth and early-twentieth century predecessors.

Does bridge retain integrity [in terms of National Register] of important elements described in Context Addendum? No \_\_\_\_ Yes X

Is bridge a significant example of work of manufacturer, designer and/or engineer? No\_ Yes\_

In the early twentieth century, metal truss bridges were largely supplanted in the state by concrete and, later, metal girder structures. The old metal fabricators disappeared during this period. They were replaced, in the 1920s and 1930s, by a new if less numerous generation of metal truss fabricators. Among the new bridge companies active in Maryland was the Roanoke Iron and Bridge Company, the McClintic-Marshall Company, and the American Bridge Company. Although according to its earlier survey form this bridge was built to plans of the State Roads Commission, it was likely actually the work of one of these three companies or one of their competitors.

Should bridge be given further study before significance analysis is made? No X Yes

It is believed that no further evaluation is necessary to determine the eligibility of this bridge for listing in the National Register. However, additional research, which could be conducted as part of any future National Register nomination prepared for the bridge, might provide further information about its history and environs.

G-II-C-101 New Casselman River Bridge Grantsville vicinity public (unrestricted)

Located east of Grantsville, Maryland, the New Casselman River Bridge carries US 40 over the Casselman River, several hundred feet south of its famous-predecessor, the Casselman Bridge on the National Road. It consists of a skew Pratt five panel steel through truss, strengthened with triangular truss sway bracing. The length of the truss is 133 feet, while the roadway width is 40 feet.

Erected in 1932, this structure was built according to in-house designs of the Maryland State Roads Commission, under Chief Engineer H.D. Williar. This bridge is one of three historic truss bridges -- part of Maryland's state road system in Garrett County, and one of 26 bridges of the same general structural type throughout the state road network -- identified by the Maryland Historical Trust for the Maryland Department of Transportation in a jointly conducted survey which took place during 1980-81.

The new Casselman bridge carries U.S. 40 over the Casselman river in a generally east west direction, several hundred feet to the south of its famous stone predeccessor. It consists of a skew pratt five panel steel through truss with triangular truss sway bracing. The length of each side of the truss is 133 feet; the roadway width is 40°. Shoulders for both sides of the two lane road are carried within the truss. The estreme points of the skew are the northwest and southeast corners.
