

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. The New Bascule Bridge over the Calumet River, Chicago

By Oscar Wacker

Car Distributor, South Chicago

THE new bridge across the Calumet River at South Chicago, was put into service on Monday, September 28th, 1914. Train

F. S. HARVEY, RESIDENT ENGINEER

In June, 1906, the City Council of Chicago passed an ordinance requiring the Baltimore & Ohio Railroad to elevate its roadbed over the streets on each side of the Calumet River. This would have necessitated the raising of existing draw span at the Calumet River, but in January, 1910, the War Department of the United States Government ordered the railroads crossing the Calumet River at this point to provide a better channel for the passage of boats. A clear channel of 140 feet was demanded in place of the old channel of eighty-five feet. This order, of course, made necessary the construction of an entirely new bridge.

H. A. FIELD, ASSISTANT ENGINEER OF BRIDGES AND BUILDINGS

No. 8, the first passenger train to use the the new structure, crossed at 11.55 a.m.

This bridge is the largest single leaf Bascule span in the world, the movable span being 235 feet long. Thirteen hundred and fifty tons of structural steel, one hundred and fifty tons of machinery, and twenty-two hundred tons of concrete counter weight go to make up this monster piece of machinery.

There existed at the crossing in 1910 three draw spans which carried the tracks of the Baltimore & Ohio, L. S. & M. S. and the P. F. W. & C., respectively. These bridges, when opened, only cleared each other at the ends by a few inches. The method of building the new bridges, therefore, had to be carefully worked out in order that traffic over the old bridges should not be interrupted.

COLOSSAL IN SIZE, THIS BASCULE BRIDGE HAS THE PRECISION OF FINE WATCH WORKS
(Photo by Wegener)

The work on the foundations of the Baltimore & Ohio bridge was started in July, 1911, and completed the following spring. These foundations consist of twelve foot concrete cylinders, connected at the top by reinforced concrete girders, and which extend to the solid rock at a depth of about seventy feet below the surface of the water.

The erection of the superstructure was started in July, 1912, and was com-

W. F. BOOTH, ASSISTANT TRAINMASTER
SOUTH CHICAGO

pleted in the spring of 1913. The bridge was erected in the open position, and lowered after completion. As an example of the accuracy with which the work was done in the shop and in the field,

WILLIAM HOGAN,
SUPERVISOR OF TRACK AND EQUIPMENT

it should be noted that measurements taken at the time the bridge was first lowered, showed that it was only one quarter of an inch out of line at the extreme end.

The bridge is electrically operated with two 140 horse power alternating current motors furnishing the power. A thirty-horse power gasoline engine is pro-

CEMENT BLOCKS BALANCE THE ENORMOUS WEIGHT OF THE BRIDGE

vided to operate the bridge in case of failure of the electrical power.

The interlocking plant which is being installed at the present time is to be electrical throughout, and will be thoroughly up to date in every particular.

This valuable addition to the property of the Baltimore & Ohio Railroad was supervised during construction by J. E. Greiner, consulting engineer, Baltimore, Md. L. G. Curtis, district engineer at Chicago, had direct charge of the work in

the field, and was assisted by H. A. Field, assistant engineer of bridges and buildings, Baltimore & Ohio Chicago Terminal Railroad, F. S. Harvey, resident engineer, Baltimore & Ohio Railroad, and William Hogan, supervisor of track, Baltimore & Ohio Chicago Terminal Railroad. The assistant trainmaster, W. F. Booth, arranged for the first train to pass over this bridge.

discharges it back into the street, while the cleaned air circulates through the car.

An obvious merit of this system of ventilation is that it utilizes to the best advantage the forward motion of the car to create a current of air — a much more effective method than the use of the overhead ventilators for this purpose.

LARGEST SINGLE-LEAF BASCULE BRIDGE

THE longest and heaviest single leaf bascule bridge in the world has recently been built for the Baltimore & Ohio Railroad across the Calumet River in Chicago. This bridge is 235 feet long, and weighs more than 4,000,000 pounds. It is counterbalanced by a counterweight that consists of a huge block that contains 1,100 cubic yards of concrete.

The bridge is so designed that it is perfectly balanced in any position. All that the machinery operating it has to do is to overcome the friction in the bearings on which the structure rests. Electric power is used for the operation. The net weight of the steelwork, or superstructure, is estimated to be 3,000,000 pounds.

THE BASCULE BRIDGE OVER THE CALUMET RIVER IN CHICAGO. IT IS 235 FEET LONG, BUT IT IS RAISED AND LOWERED BY THROWING A SWITCH THAT CONTROLS AN ELECTRIC CONNECTION. THIS BRIDGE CARRIES TWO RAILROAD TRACKS; THE PROJECTING ENDS OF THE RAILS SHOW AT THE TOP OF THE PICTURE
