Republican River Pegram Truss Bridge
00 190TH RD
Concordia vicinity

LOCATION:

County: Cloud
Address: 00 190TH RD
Address Remarks: Road also known as COUNTY ROAD 795. 4 mi. E and 1.5 mi. N of Concordia
City: Concordia vicinity
Zip:
Parcel ID:
Legal Description: SE 1/4 of SW 1/4 of SW 1/4 of Section 20 Township 5S Range 2W
Legal Description Remarks:
Latitude, Longitude 1: 39.596149 -97.571108
Latitude, Longitude 2:
Latitude, Longitude 3:
Latitude, Longitude 4:
Datum: WGS84

DESCRIPTION:

Historic Name: Republican River Pegram Truss Bridge
Alternate Name:
Historic Function: Transportation
Subcategory: Road-Related (Vehicular)
Historic Function Remarks:
Present Function: Transportation
Subcategory: Road-Related (Vehicular)
Present Function Remarks:
Residential/Commercial/Religious Style:
Secondary Style:
Barn Type: Not Applicable
Bridge Type: Pegram Truss
Landscape Type: Not Applicable
Physical Description/Remarks: Pegram High Truss and 2 Warren
Plan Form: Rectangle
Commercial Building Type: Not Applicable
Roof Form: Not Applicable
Stories: 1
**Condition:** Fair  
**Principal Material:** Metal  
**Condition Remarks:**  
**Architect/Designer/Builder:** Edge Moor Bridge Works  
**Year of Construction:** 1885  
**Certainty:** Documented  
**Date Notes:**  
**General Remarks:**  
**Ancillary Structures:** None  
**Ancillary Structure Remarks:**

### REGISTER STATUS:

- **Listed in State Register:** Yes  
  - **Date of State Listing:** 08/26/1989  
- **Listed in National Register:** Yes  
  - **Date of National Listing:** 01/04/1990  

**Historic District:**  
**Demolished:**  
**Date Demolished (if applicable):**  
**Potentially Eligible for National Register:**  
**Register Status Remarks:**  
**Thematic Nomination (MPDF):** Metal Truss Bridges in Kansas  
**National Historic Landmark:**

### SURVEY INFORMATION:

**Survey 1**  
**Survey Project Name:** Kansas - KDOT/Historic Bridge Inventory - Metal Truss Bridges  
**Sequence Number:**  
- **Surveyed By:** KDOT  
- **Survey Date:** 11/19/1981

National Register of Historic Places
Registration Form

This form is for use in nominating or requesting determinations of eligibility for individual properties or districts. See instructions in Guidelines for Completing National Register Forms (National Register Bulletin 16). Complete each item by marking "x" in the appropriate box or by entering the requested information. If an item does not apply to the property being documented, enter "N/A" for "not applicable." For functions, styles, materials, and areas of significance, enter only the categories and subcategories listed in the instructions. For additional space use continuation sheets (Form 10-000a). Type all entries.

1. Name of Property
   historic name Republican River Pegram truss
   other names/site number Republican River Pegram Truss

2. Location
   2 miles north of intersection of K9 and F.A.S. 566 on Route 795
   street & number
   city, town Concordia
   state Kansas code KS county Cloud code 29 zip code 66901

Describe present and historic physical appearance.

The Republican River Pegram Truss bridge is made up of three spans. Two double intersection Warren trusses, both 128 feet long, and a 203 foot long Pegram truss. The roadway is 15 feet wide. The bridges rise 20 feet above the level of the river. The members of a truss bridge are designated either as chord members or web members. Chord members are those mainly defining the outlines of the structure and they are termed lower or upper chord members depending on whether they are found at the bottom or the top of the structure. Members between the chords are web members. They are called posts or ties if they sustain compression or tension respectively. In the instance of the double intersection Warren trusses, the structure in indeterminate, members act in both compression as well as tension. Two triangular web systems are superimposed upon each other. They could also be termed lattice bridges. In the case of the Pegram truss, it is a hybrid between the Warren and Parker trusses with the upper chords all being equal length.

The inclined end posts and top chord of the double intersection Warren trusses are fabricated from sections of channel iron, tied together by single bar lattice. The girders thus formed are topped with a steel or iron cover plate. Diagonals alternate between sections of angle plate riveted to a steel or iron cover plate and angle plate tied together with flat horizontal bars. Upper lateral struts are fabricated of single bar lattice and angle plate. The portal bracing is fabricated from angle stock and forms an interlocking triangle design. The Pegram truss, the inclined end posts and polygonal top chord are fabricated from channel plate, tied together by bar lattice and topped with a cover plate. Likewise, the compression posts are fabricated from channel plate and tied together with bar lattice. Ties consist of flat eye bars. Upper lateral bracing is formed from angle stock and bar lacing. The portal bracing is formed from angle stock and bar lattice. The structure is pin connected.

Although the bridge was initially constructed to service rail traffic and has been modified to highway vehicular traffic, those modifications have not adversely affected its structural integrity.

☐ See continuation sheet
The great evolution of truss bridge construction began in the United States soon after the publication of Squire Whipple's historic work on stresses in 1840. Prior to this the design work was essentially that of trial and error, experience and judgement. The Warren and Pratt trusses were rational designs and lent themselves readily to the system of analysis postulated by Whipple. They were, therefore, readily and rapidly accepted and formed the foundation for a greater part of American truss design. The double intersection Warren truss and the Pegram truss were both modifications of the original Warren and Pratt designs.

Republic river bridge was erected in 1893 by Edge Moore Bridge Works of Wilmington, Delaware as a railroad bridge. The crossing was first used by the Junction City and Fort Kearney Railroad. The remains of bents in the river likely represents the presence of the structure that predated the present one. At an undetermined date the route was abandoned and the crossing turned over to vehicular traffic.

Edge Moore Bridge Works started fabrication in 1873, although the iron works was in operation earlier. It was acquired by American Bridge Company in 1900. One of their specialties was the erection of railroad bridges.

The Pegram truss and the double intersection Warren trusses represent the only example of such designs on the Kansas road system. Although not currently used for its original purpose it is an excellent example of adaptive reuse by local communities. It offers the unique opportunity to experience two different modes of transport, vehicular and rail.

The Kansas Department of Transportation (KDOT) carried out a statewide inventory of historic bridges between 1980 and 1983. The bridges to be included were identified through computer printouts developed by KDOT, from information supplied by the counties (since almost all of the historic

Verbal Boundary Description
The nominated property is located on the SE 1/4, SE 1/4, SW 1/4, SW 1/4, section 20, township 5N, range 2W, on a tract measuring 459' x 15' whose northeast corner is represented by the northeast corner of the bridge. Beginning at the northeast corner the boundary proceeds 459 feet southwest, 15 feet northwest, 459 feet northeast, and 15 feet southeast to the point of beginning. See continuation sheet

Boundary Justification
The boundary includes only that area that is historically associated with the nominated property.

11. Form Prepared By
name/title Larry Jochims
organization Kansas State Historical Society
date September 20, 1989
street & number 120 W. 10th
city or town Topeka
state KS zip code 66612
bridges were located on secondary rather than primary road system), and by
direct observation by field personnel. All bridges were inspected by KDOT
personnel to verify the data on file. That information was jointly
evaluated by representatives of KDOT, Kansas State Historical Society, and
the State Historic Preservation Officer.

Each structure was evaluated using a points rating system adapted from
the points evaluation rating developed by the Ohio Department of
Transportation and Ohio Historic Preservation Office. Consideration was
given to areas such as age, builder, number of spans, length, special
features, history, integrity, surviving numbers, and preservation
potential.

In many instances there is little information about individual
structures. Often bridge plaques which may have contained information have
been removed, or the county's records are not complete or have been
destroyed. Due to the large numbers of similar structures there is often
little to choose from in differentiating among individual bridges other
than condition and the likelihood of preservation.

The purpose of the KDOT study and subsequent evaluation was to
identify a representative selection of bridges of each class. Through this
approach KDOT and KSHS hope to preserve for posterity some examples of each
type.
